Chapter 1. Release Notes for IBM® Rational® Test Automation Server

This document includes information about What's new, installation and upgrade instructions, known issues, and contact information of IBM Customer Support.

Contents

- Description on page 7
- What's new on page 7
- Installing Rational Test Automation Server on page 9
- Known issues on page 9
- Contacting IBM Rational Software Support on page 9

Description

Rational® Test Automation Server is a server that includes capabilities such as project and role-based security,

Docker-based distribution and installation, and running of test cases. For more information about the server, see IBM

Rational Test Automation Server overview on page 16.

What's new

The following sections list the new features, enhancements or other changes made in this release.

• Introducing Team Spaces on Rational® Test Automation Server

Rational® Test Automation Server is now provisioned to display an initial Team Space, which is a logical partition of Rational® Test Automation Server.

The operations that you managed at the server level can now be performed at the Team Space level. You can now configure licenses or an SMTP server, create projects, register the remote agents, dockers, or intercepts within a Team Space. See Team Space overview on page 78.

· System modeling

- You can create a system model to view the logical representation of any application under test in a
 Team Space. The system modeling is a Tech Preview feature.
- You can configure a Team Space repository, which is different from the project repository, to save the system model.
- You can create components that represent different types of assets and associate the components by defining the relationship between the components. You can also create child components for components. You can use these concepts to build a system model and view the model. You can then publish the system model to the Team Space repository.
- You can also associate the virtual services in a project repository with components of the system model. From the associated component, you can view and run the virtual services.

See System modeling on page 107.

Working with virtual services

You can now view the virtual service resources that are in your project repositories from the **Resources** page and then configure a run of the virtual service. Working with virtual services is a Tech Preview feature.

After you start a virtual service, the running instances can be viewed from both the **Resources** page and **Instances** page.

You can perform the following tasks on virtual services:

- View information about the details, behavior, usage, routing rules, and diagnostic information of the virtual service instance.
- Modify the behavior or the logging level of a running instance.

See Management of virtualized services on page 226.

Stubs are excluded from Execution and Progress pages

Starting from 10.1.3, stubs are not displayed on the **Execution** page to start them nor are they displayed on the **Progress** page after they are started. Stubs must be started from the **Virtualization > Resources** page and stubs that are running can be viewed from the **Virtualization > Instances** page.

See Management of virtualized services on page 226.

· Agents are selected automatically for an override

When you install static agents V10.1.2 and add the agents to your project on Rational® Test Automation Server, Rational® Test Automation Server determines and then displays the capabilities of the agents. Further, Rational® Test Automation Server compares the capabilities of the agents with the required capabilities specified for the agent in the test assets and automatically selects the most suitable agent for an override. You can either proceed with running the test on the agent selected or select an agent from the agents displayed that have the same capabilities. See Adding an agent to a project on page 142.

· Working with capabilities that you define for static agents

When you install static agents V10.1.3 and register them with Rational® Test Automation Server, you can add, view, edit, or delete the capabilities of static agents. See Working with agent capabilities on page 144.

· Refreshing of the migrated project repositories

After you migrate a project from a previous version to a later version of Rational® Test Automation Server, the repositories that are configured for the project are refreshed only after the project owner logs in to Rational® Test Automation Server.

Installing Rational® Test Automation Server

- For instructions about installing the software, see Installation of the server software on page 25.
- For instructions about upgrading the software, see Server software upgrade methods on page 45.

Known issues

You can find information about the known issues identified in this release of Rational® Test Automation Server.

Known problems are documented in the download document for each product and in the form of individual technotes in the Support Knowledge Base:

Table 1. Download documents and technotes

Product	Download document	Knowledge base
Rational® Test Automa-	Release document	Knowledge articles
tion Server		

The knowledge base is continually updated as problems are discovered and resolved. By searching the knowledge base, you can quickly find workarounds or solutions to problems.

Contacting IBM Rational Software Support

- For contact information and guidelines or reference materials that you might need when you require support, read the IBM Support Guide.
- For personalized support that includes notifications of significant upgrades, subscribe to Product notification.
- Before you contact IBM Rational Software Support, you must gather the background information that you
 might need to describe your problem. When you describe a problem to an IBM software support specialist,
 be as specific as possible and include all relevant background information so that the specialist can help you
 solve the problem efficiently. To save time, know the answers to these questions:
 - What software versions were you running when the problem occurred?
 - Do you have logs, traces, or messages that are related to the problem?
 - · Can you reproduce the problem? If so, what steps do you take to reproduce it?
 - Is there a workaround for the problem? If so, be prepared to describe the workaround.

Chapter 2. System Requirements

This document includes information about hardware and software requirements for IBM® Rational® Test Automation Server.

You assume sole responsibility for any results you obtain or decisions you make as a result of this report.

Notwithstanding the Terms of Use (https://www.ibm.com/legal/us/en/), users of this site are permitted to copy and save the reports generated from this tool for such users own internal business purpose. No other use shall be permitted.

Hardware

You can find information about the hardware requirements for IBM® Rational® Test Automation Server.

Hardware	Platform	Requirement	Notes
Disk space	Container	256 GB	Additional resources are required by the cluster for the execution of test assets.
Memory	Container	32 GB	Additional resources are required by the cluster for the execution of test assets.
Processor	Container	8 CPUs	Additional resources are required by the cluster for the execution of test assets.
Network	Container	Gigabit (1000) Ethernet	
Other hardware	Container		Operating system support is specified by the supported platforms: Kubernetes and OpenShift. Refer to their associated documentation for a list of supported operating systems.

Operating systems and Containers

You can find details about the supported operating systems and containers.

Contents

- Operating systems on page 12
- Containers on page 12

Bit version support

Different parts of a product might run on the same operating system but support different application bitness.

For example, one part of the product might run only in 32-bit mode, whereas another might support 64-bit tolerate mode.

Bitness	Description
64-Tolerate	The product or part of the product runs as a 32-bit application in the 64-bit platforms listed as supported.
64-Exploit	The product or part of the product runs as a 64-bit application in the 64-bit platforms listed as supported.

Operating systems

Operating system	Hardware	Bitness	IBM® Rational® Test Automation Server	Notes
Ubuntu Server 18.04 LTS	x86-64	64-Exploit	~	Running K3s v1.19
Ubuntu Server 20.04 LTS	x86-64	64-Exploit	~	Running K3s v1.19

Containers

You can find details about the supported containers.

Container	Runtime	Version	Notes
IBM® Rational® Test Automation Server	OpenShift Container Platform	4.5	The Container Platform that is supported by OpenShift V4.5.24.

Related information

System Requirements on page 10

Host prerequisites

You can find the prerequisites that support the operating capabilities for IBM® Rational® Test Automation Server.

Contents

- Licensing on page 13
- Web browsers on page 13

Licensing

License Server	Version	IBM® Rational® Test Automation Server	Notes
IBM Rational License Key Server	8.1.6	~	Optional.
			Required for high-performance load tests.

Web browsers

Browser	Version	IBM® Rational® Test Automation Server
Apple Safari	13 or later	~
Google Chrome	78 or later	~
Microsoft Edge	80 or later	~
Microsoft Edge Chromium	86 or later	~
Mozilla Firefox (including ESR versions)	68 or later	~

Related information

System Requirements on page 10

Supported software

You can find details about the additional software that are supported.

Contents

- Development tools on page 14
- Runtime environment on page 14

Development tools

Supported software	Version	IBM® Rational® Test Automation Server
Git	2.19.0	~
	2.22.0	~

Runtime environment

Supported software	Version	IBM® Rational® Test Automation Server	Notes
Helm CLI	3.4	~	Required locally for Helm.
	3.3.4	~	
Jaeger Operator	1.20	~	Required if tests contribute trace information. The version depends on the target platform.
OCP CLI (oc)	4.5	~	Required locally for OCP.
	4.4	~	

Supported software	Version	IBM® Rational® Test Automation Server	Notes
OpenShift Container Plat- form (OCP)	4.5	~	The Container Platform that is supported by OpenShift V4.5.24.
	4.4	~	The Container Platform that is supported by OpenShift V4.4.3.
OpenShift Container Storage (OCS)	4.5	~	The storage class must support ReadWriteMany
age (OOS)	4.4	~	(RWX) so that executions can be performed on all nodes.

Chapter 3. Getting Started Guide

This guide provides an overview and describes the task flows to get you started with Rational® Test Automation Server. This guide is intended for new users.

IBM® Rational® Test Automation Server overview

IBM® Rational® Test Automation Server brings together test data, test environments, and test runs and reports into a single, web-based browser for testers and non-testers.

IBM® Rational® Test Automation Server provides the following capabilities:

Web-based continuous testing platform

Rational® Test Automation Server is a web-based continuous testing platform built on modern, cloud native technologies that enables test teams to run a breadth of tests that includes API, functional, and performance tests and to benefit from a holistic view of test progress. Rational® Test Automation Server is built on Docker for easy deployment. You can scale your testing on the cloud or remote on premise systems with native Docker, Kubernetes, and IBM Red Hat OpenShift support.

Role-based access and security

Security is a key concern for IBM clients and therefore, Rational® Test Automation Server brings a comprehensive, role-based access control scheme to the server with project owners assigning specific member's key permissions (by using roles), for example managing test data or working with secrets such as passwords.

Running of tests from the server by using Docker containers

Server-based running of tests is the starting point for Rational® Test Automation Server. For members of a project with the appropriate role, Rational® Test Automation Server enables direct running of tests from the browser by using transient Docker containers.

Connected agents for existing performance agents

Agent owners can connect existing performance agents to the server and add them to a project for running schedules and Accelerated Functional Testing (AFT) Suites on the current infrastructure.

Project overview statistics

The Overview page for Rational® Test Automation Server offers you a quick, simple view on the state of testing for your projects.

Project home page

The home page lists your projects and other projects, which makes it easy to manage different projects within an organization.

Reporting and the Resource Monitoring Service

Rational® Test Automation Server provides the home for capabilities that previously were hosted on Rational® Test Control Panel. Reporting and the Resource Monitoring Service are in Rational® Test

Automation Server and provide a more direct relationship with their related projects. These capabilities also benefit from the project level, role-based access controls. You can view unified test results to help you make informed business decisions.

Test data authoring

Beyond the concept of a project held in a Git repository for a simple location of tests and related assets, you can do full concurrent editing of test data sets directly from Rational® Test Automation Server. This true multiuser capability enables team members to collaborate more easily as well as try out data changes without impacting the rest of the team. When satisfied with the results, team members can push their changes.

Integration with DevOps tools

You can integrate Rational® Test Automation Server with various popular DevOps tools like Jenkins, UrbanCode Deploy, and Microsoft Azure DevOps to get more value from your DevOps pipelines. You can use UrbanCode Deploy to define a deployment process that automatically triggers test cases and have those test insights available directly within UrbanCode Velocity. With the Microsoft Azure DevOps integration, you can also define a DevOps pipeline that includes direct execution of tests by using the Rational® Test Automation Server scalable infrastructure. Rational® Test Automation Server also integrates with Jira for defect tracking and GitHub for software source management and version control.

Supported versions of assets and resources

You can find information about the versions of assets, resources, agents and Dockers that are supported in Rational® Test Automation Server. You can also find information about the versions of the desktop clients that are supported.

The following table lists the versions of assets or resources created in the desktop clients along with the agents, Dockers, or proxies that are supported in Rational® Test Automation Server:

Resource	Supported	Not supported
Assets or resources created in IBM® Rational® Functional Tester	Assets or resources created in Ratio- nal® Functional Tester which are of versions earlier or the same as Ratio- nal® Test Automation Server.	Assets or resources created in any later version of Rational® Functional Tester that is later than the version of Rational® Test Automation Server.
Assets or resources created in IBM® Rational® Integration Tester	Assets or resources created in Ratio- nal® Integration Tester which are of versions earlier or the same as Ratio- nal® Test Automation Server	Assets or resources created in any later version of Rational® Integration Tester that is later than the version of Rational® Test Automation Server.
Assets or resources created in IBM® Rational® Performance Tester	Assets or resources created in Rational® Performance Tester which are	Assets or resources created in any later version of Rational® Performance Tester that is later than the

Resource	Supported	Not supported
	of versions earlier or the same as Rational® Test Automation Server	version of Rational® Test Automation Server.
IBM® Rational® Performance Tester Agents	Rational® Performance TesterA- gents which is the same version as Rational® Test Automation Server	Before you install the agents that are of the current version, see Agents overview on page 139.
Dockers on a remote host computer	Image of Rational® Test Automation Server which is the same version as Rational® Test Automation Server that you want to use to run tests, must be installed on the Docker on a remote host computer.	Before you set up Dockers remotely, see Managing Docker hosts on page 146.
HTTP proxies	Installation of the proxy component from Rational® Test Control Panel which is the same version as Ratio- nal® Test Automation Server.	Before you use HTTP proxies, see Setting up the HTTP proxy on page 230.

If there is a mismatch in the versions of the assets, resources, agents, or images used in Dockers with the version of Rational® Test Automation Server that you are using, any of the following events can occur:

- · Warnings or Errors are displayed when you add a repository to a project in your team space.
- Warnings or Errors are displayed when you open a project that you migrated from a previous version of Rational® Test Automation Server.
- Warnings or Errors are displayed when you add or manually refresh a repository to which you added assets or resources that were created on a desktop client with a version previous to or later than the version of Rational® Test Automation Server that you want to use.
- Test runs that you start or schedule on an agent or Docker fail to run.
- You cannot view the proxies that are registered with Rational® Test Automation Server on the **Agents and Intercepts** page.

Tests supported on Rational® Test Automation Server

You can find information about the types of tests that you can configure for a test run in a project on Rational® Test Automation Server. You can also find information about the desktop clients in which you can create the test.

The following table lists the test types that are supported and those tests that are not supported for running on Rational® Test Automation Server:

Product	Supported test runs	Not supported test runs
IBM® Rational® Functional Tester	Accelerated Functional Testing (AFT) Suites Compound Tests that contain any of the following types of tests:	Traditional non-HTML tests. An independent Web UI test and a mobile test outside of a Compound Test or an AFT Suite.
IBM® Rational® Integration Tester	API Suites that include the following Test Suites: • Test Suites that contain scenarios with references to local stubs. • Test Suites that contain stubs that virtualize services run in any Kubernetes cluster or in the Kubernetes cluster that hosts Rational® Test Automation Server.	Test Suites that have tests with subscribe actions that operate in the watch mode. A stand-alone API test case cannot be run independently. An API test case must be part of a Test Suite.
IBM® Rational® Performance Tester	Compound Tests that contain performance tests Rate Schedules VU Schedules	A single test script of any test extension. Tests that belong to 32-bit test extensions and SOA Quality included in VU Schedule, Rate Schedule, and Compound Test.

Note: You must create compound tests for the same type of tests. For example, you can create a compound test that has different mobile tests that use different mobile testing platforms.

Restriction: You cannot merge folders that contain different test projects in the same project directory. For example, you cannot create a project directory that contains a Performance test project and an API Suite project. You must create separate project directories for each test type. For example, you must create the

Performance test in the project directory as /MyPerfProject/ and the API Suite in the project directory as /MyAPIProject, before you commit the projects to the remote repository.

- 8. Installing Rational Performance Tester Agent
- 9. Enablement of Resource Monitoring services for a schedule

Related information

Managing access to server projects on page 369

Accessibility features

Accessibility features help users who have physical disabilities, such as visual and, hearing impairment, or limited mobility, to use the software products successfully.

Accessibility compliance

To understand the accessibility compliance status for IBM® Rational® Test Automation Server, refer to Accessibility Conformance Reports.

For more information about IBM and accessibility, refer to IBM Accessibility.

The product documentation is published by using Oxygen XML WebHelp Responsive. To understand the accessibility compliance status for Oxygen XML WebHelp Responsive, refer to WebHelp Responsive VPAT Accessibility Conformance Report.

Accessing UI elements

Rational® Test Automation Server supports navigation in the UI by using different methods such as a mouse, keyboard, or touchpad.

You can use the keyboard keys such as **Tab**, arrow keys such as **UP**, **DOWN**, **LEFT**, and **RIGHT** to navigate to the different pages in the **Navigation** pane or to the different action labels in the right pane on the UI.

Chapter 4. Administrator Guide

This guide describes how to install IBM® Rational® Test Automation Server software. After you install the software, you can perform administration tasks such as license configuration, user management, security, memory, and disk usage management, back up and restore user data. This guide is intended for administrators.

Installation of the server software

To get started with IBM® Rational® Test Automation Server, you must first install the server software.

You can install Rational® Test Automation Server on the following platforms:

- Red Hat OpenShift V4.5
- Ubuntu server (using k3s)

Task flow for installing the sever software on Red Hat OpenShift

You must perform the following tasks to install Rational® Test Automation Server:

- 1. Set up a Red Hat OpenShift Container Platform.
- 2. Install the Jaeger operator to trace test logs and Jaeger-based reports when you run tests.
- 3. Install the OpenShift Container Platform command-line interface (CLI) and the Helm software.
- 4. Install Rational® Test Automation Server.
- 5. Configure and manage the license.

Task flow for installing the sever software on Ubuntu

You must perform the following tasks to install Rational® Test Automation Server:

- 1. Set up a Ubuntu server.
- 2. Install the OpenSSH server and the Helm software.
- 3. Set up the k3s Kubernetes environment by using the provided script.
- 4. Install Rational® Test Automation Server.
- 5. Configure and manage the license.

Installation of the server software on Red Hat OpenShift

You can find information about the tasks that you can perform to install Rational® Test Automation Server software on the Red Hat OpenShift platform.

Prerequisites for installing the server software on Red Hat OpenShift

You must first complete certain tasks before you install Rational® Test Automation Server on the Red Hat OpenShift platform.

The following sections describe each prerequisite in detail:

- Internet access on page 26
- Entitlement key on page 26
- Red Hat OpenShift platform on page 26
- Mandatory software on page 27
- Persistent storage on page 27
- Service virtualization through Istio on page 28

Internet access

You must have access to the internet to install Rational® Test Automation Server.

Entitlement key

You must copy an **Entitlement key** from Container software library to pull the images used by the server software. For more information, refer to Creating an API key.

Red Hat OpenShift platform

You must set up the Red Hat OpenShift platform and install the following components in your IT infrastructure:

- Red Hat OpenShift Container Platform V4.5. For more information, refer to the Red Hat OpenShift documentation.
- Dynamic Volume Provisioning that supports ReadWriteOnce (RWO) and ReadWriteMany (RWX) access
 modes. For more information, refer to the Dynamic provisioning section in the Red Hat OpenShift
 documentation.
- Jaeger operator to trace test logs and Jaeger-based reports when you run tests. For more information, refer to Installing Jaeger.
- Optional: Red Hat Service Mesh V2.0, if Istio recording and service virtualization features are required. For
 more information, refer to the Installing Red Hat OpenShift Service Mesh section in the Red Hat OpenShift
 documentation.

For more information about the service virtualization feature, see Management of virtualized services on page 226.

• Optional: You can configure the OpenShift software-defined networking (SDN) to provide a unified cluster network that enables the communication between pods across the OpenShift Container Platform cluster. The default installation process includes the NetworkPolicy resources and these resources are acted upon only if you configure the SDN appropriately. For more information, refer to the OpenShift SDN default CNI network provider section in the RedHat OpenShift documentation.

You must have access to the OpenShift cluster with cluster administrator privileges. You can run the following command on the OpenShift command-line interface to gain access:

```
oc login -u kubeadmin -p {password} https://api.{openshift-cluster-dns-name}:6443
```

For more information about hardware and software requirements, see System Requirements on page 10.

Mandatory software

You must install the following software on Red Hat OpenShift:

- Helm V3.5.2. For more information, refer to the Installing a Helm chart on an OpenShift Container Platform cluster section in the Red Hat OpenShift documentation.
- OpenShift CLI. For more information, refer to the Getting started with the CLI section in the Red Hat OpenShift documentation.

Persistent storage

Rational® Test Automation Server requires persistent storage in addition to the minimum resources required by the cluster. Depending on the workload, you might require additional persistent storage.

The default configuration creates the PersistentVolumeClaim that dynamically provision the PersistentVolume. The following table lists the PersistentVolumeClaim, its size, and access mode during the configuration:

PersistentVolumeClaim	Size	Access Mode	Content
data-{my-rtas}-post- gresql-0	26 GB	ReadWriteOnce	User data used by services
		CLI Abbreviation:	
		RWO	
data-{my-rtas}-rabbitmq-0	8 GB	RWO	Notifications between services
data-{my-rtas}-results-0	8 GB	RWO	Reports
data-{my-rtas}-tam-0	32 GB	RWO	Cloned git repositories
data-{my-rtas}-userlibs-0	1 GB	ReadWriteMany	User provided third party libraries and extensions
		CLI Abbreviation: RWX	

Note: {my-rtas} is the name of release that is provided during the installation of the server software.

Service virtualization through Istio

Disclaimer: This release contains access to the Virtual services that virtualize the Istio based services feature in IBM® Rational® Test Automation Server as a Tech Preview. The Tech Preview is intended for you to view the capabilities for virtualized services offered by Rational® Test Automation Server, and to provide your feedback to the product team. You are permitted to use the information only for evaluation purposes and not for use in a production environment. IBM provides the information without obligation of support and "as is" without warranty of any kind.

To provide your feedback, you can send an email to devops 24@us.ibm.com.

The default configuration does not enable service virtualization through Istio. To use the service virtualization feature, you must configure it appropriately. As a Tech Preview feature, you can virtualize the *bookinfo* sample application. You must install this application in the <code>Bookinfo</code> namespace. For more information about the *bookinfo* application, refer to the Istio documentation.

For more information about how to enable service virtualization through Istio, see Installing the server software on Red Hat OpenShift on page 32.

Installing the server software on Red Hat OpenShift

You can install Rational® Test Automation Server on the Red Hat OpenShift server that has the Kubernetes Engine environment to run functional, integration, and performance tests. Rational® Test Automation Server combines test data, test environments, and test runs and reports into a single web-based browser for testers and non-testers.

Before you begin

You must have performed the following tasks:

- Completed tasks provided in the Prerequisites section. See Prerequisites for installing the server software on Red Hat OpenShift on page 26.
- · Installed the following software:
 - · OpenShift CLI
 - ∘ Helm
- Copied the Entitlement key from the Container software library.
- 1. Open and log in to the terminal.
- 2. Create a namespace to install the server software by running the following command:

```
oc new-project test-system
```

Remember: test-system is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the test-system in all the instances in this procedure.

3. Add the entitlement registry to Helm to access the server install charts by running the following command:

```
helm repo add ibm-helm https://raw.githubusercontent.com/IBM/charts/master/repo/ibm-helm
```

4. Run the following command to get the latest updates from the repository:

```
helm repo update
```

5. Create a Secret to pull images that are used by Rational® Test Automation Server by running the following commands:

```
oc create secret docker-registry cp.icr.io \
-n test-system \
--docker-server=cp.icr.io \
--docker-username=cp \
--docker-password={your_entitlement_key} \
--docker-email=example@abc.com
```

- You must substitute {your_entitlement_key} with the key that you copied from Container software library.
- You can replace example@abc.com with the administrator email address, if required.
- 6. Perform one of the following steps to enable certificates as trusted certificates:
 - a. Perform the following steps to add the Certificate Authority (CA) into a Secret:
 - i. Run the following command to verify whether an additional CA is required:

```
curl -sw'%{http_code}' -o/dev/null \
"https://wildcard.$(oc get -n openshift-ingress-operator ingresscontroller default
-ojsonpath='{.status.domain}')"
```

If the result of the command is 503, the CA is already trusted. You must continue with 7 on page 30.

If the result of the command is 000, then CA must be added into a Secret. You must continue with 6.a.ii on page 29.

ii. Run the following command to get the default CA in a PEM format:

```
oc get -n openshift-ingress-operator secret router-ca -ojsonpath='{.data.tls\.crt}'
| base64 --decode > ca.crt
```

iii. Run the following command to validate that the CA used to sign the certificate is same for ingress:

```
curl -sw'%{http_code}' -o/dev/null --cacert ca.crt \
"https://wildcard.$(oc get -n openshift-ingress-operator ingresscontroller default
-ojsonpath='{.status.domain}')"
```

The result of the command must be 503.

If the result of the command is 000, then the certificate configuration has been customized. You must find the certificate of the signer to go to the next step.

iv. Run the following command to create an ingress Secret to store the CA:

```
oc create secret generic -n test-system ingress --from-file-ca.crt-ca.crt
```

- b. Perform the following steps to add the Certificate Authority (CA) into a Secret if you are using OpenShift Service Mesh service virtualization, a Tech Preview feature:
 - i. Run the following command to retrieve the charts:

```
helm pull --untar ibm-helm/ibm-rtas-prod --version 4.1013.0
```

ii. Run the following script from the files directory:

```
./files/certificate.sh -n istio-system -s istio-ingressgateway-certs
{openshift-cluster-dns-name}
```

iii. Run the following command to create an ingress Secret:

```
oc create secret generic -n test-system ingress \
"--from-literal=ca.crt=$(oc get -n istio-system secret istio-ingressgateway-certs
-ojsonpath='{.data.ca\.crt}' | base64 --decode)"
```

iv. Run the following commands to enable an OpenShift route that the product creates for the Istio gateway:

```
cat <<EOF | oc apply -n istio-system -f - >/dev/null
apiVersion: maistra.io/v1
kind: ServiceMeshMemberRoll
metadata:
   name: default
spec:
   members:
    - test-system
EOF
```

When some components such as static agents or Docker agents want to communicate with Rational® Test Automation Server, the component presents its certificate to the server to verify its identity. Rational® Test Automation Server trusts the component only if it is signed by a recognized and trusted CA. Therefore, you must add the signed CA into a trust by placing it in a Secret to enable certificates as trusted certificates.

7. Perform the following steps to install the server software:

You must go to step 7.c on page 31 if you have completed step 6.b on page 30.

a. Run the following command to get the latest updates from the repository:

```
helm repo update
```

b. Run the following command to retrieve the charts required to install the server software:

```
helm pull --untar ibm-helm/ibm-rtas-prod --version 4.1013.0
```

c. Run the following commands to update the runAsUser and fsGroup to match the Security Context Constraints (SCC):

Rational® Test Automation Server is compatible with the restricted Security Context Constraint. You must run this command to ensure that the runAsUser and fsGroup strategies match with the SCC policy.

d. Perform one of the steps described in the following table to install the server software based on your requirement:

Step description	Step no
To install the server software	Go to step 7.d.i on page 32
To install the server software and enable OpenShift Service Mesh service virtualization, a Tech Preview feature	Go to step 7.d.ii on page 32
To install the server software and enable Jaeger for performance and Web UI tests logs	Go to step 7.d.iii on page 32

Remember:

• If you are upgrading from the previous version, then you must use the same value for the global.persistence.rwxStorageClass parameter that you used in the previous installation.

You can run the following command to obtain the value that you used for global.persistence.rwxStorageClass:

```
oc get pvc -n test-system data-{my-rtas}-userlibs-0 \
   -ojsonpath='{.spec.storageClassName}' && echo
```

 The default certificate that terminates TLS connections, has a single wildcard. Therefore, you must prefix a single hostname segment for the global.ibmRtasIngressDomain parameter.

For example, --set global.ibmRtasIngressDomain=rtas.{dns name of the openshift cluster}

i. Run the following command to install the server software:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-openshift.yaml \
--set global.persistence.rwxStorageClass=ibmc-file-gold \
--set global.ibmRtasIngressDomain=rtas.{openshift-cluster-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address}
```

ii. Run the following command to install the server software and to enable OpenShift Service Mesh service virtualization, a Tech Preview feature:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-openshift.yaml \
--set global.persistence.rwxStorageClass=ibmc-file-gold \
--set global.ibmRtasIngressDomain=rtas.{openshift-cluster-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address} \
-f ibm-rtas-prod/values-openshift-demo.yaml
```

Important: You must run the following command to enable service virtualization in the specific namespace:

Where, {my-rtas} is the release name that you provided during the installation of the server software.

```
oc create rolebinding istio-virtualization-enabled -n
bookinfo --clusterrole={my-rtas}-execution-istio-test-system
--serviceaccount=test-system:{my-rtas}-execution
```

Note: When you uninstall the chart, the manually created role bindings are not deleted from the namespace. You can run the following command to delete the role bindings:

```
oc delete rolebinding istio-virtualization-enabled -n bookinfo
```

iii. Run the following command to install the server software and to enable Jaeger for performance and Web UI tests logs:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-openshift.yaml \
--set global.persistence.rwxStorageClass=ibmc-file-gold \
--set global.ibmRtasIngressDomain=rtas.{openshift-cluster-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address} \
--set-string execution.annotations.sidecar\\.jaegertracing\\.io/inject=true \
--set global.jaegerAgent.enabled=true \
--set global.jaegerAgent.internalHostName=localhost \
--set global.jaegerDashboard.enabled=true \
--set global.jaegerDashboard.externalURL={my-jaeger-dashboard-url}
```

You must substitute the value of the variables in the helm install command with the actual value:

• {my-rtas} with the release name of your choice.

Note: The release name must consist of lower case alphanumeric characters or "-" (hyphen), start with an alphabetic character, and end with an alphanumeric character. For example, *my-org* or *abc-123*.

• {openshift-cluster-dns-name} with the ingress DNS name that you selected for the server.

Remember: You must provide the value that consists of lowercase alphanumeric characters, "-"(hyphen) or "."(period). Also, the value must start and end with an alphanumeric character.

Note: You can run the following command to obtain the default value of ${\tt openshift-}$

cluster-dns-name:

```
oc get --namespace=openshift-ingress-operator ingresscontroller/default
  -ojsonpath='{.status.domain}'
```

• {password-seed} with a value of your choice.

Important: This password seed is used to create several default passwords for the server. You must store the password seed securely. When you install the server software by using the backup of the user data, you can reuse the password seed. You

- !
- can use this seed to restore backup files either on the current or later versions of the server software.
- Optional: {rlks-ip-address} with the IP address of Rational License Key Server, if you are setting the license value for the first time.
 - !
- **Important:** If you are upgrading the product from the previous version, you must configure the **Rational License Key Server** value in the **License Configuration** window when the installation of the server is complete.
- {my-jaeger-dashboard-url} with the URL of the Jaeger server.
- 8. Optional: Run the following command to remove a job that is used to initialize the PostgresQL database during the installation of the server software:

```
oc delete job {my-rtas}-postgresql-init -n test-system
```

- 9. **Optional:** Perform the following steps to migrate user data into Rational® Test Automation Server, if you upgraded from the previous version:
 - a. Run the following script from the ibm-rtas-prod/files directory to create a directory that contains metadata related to the Persistent Volume Claims and their Persistent Volumes:
 migrate.sh create-pvcs -n test-system {my-rtas}
 - b. Run the following script from the ibm-rtas-prod/files directory to merge the data into the server: migrate.sh merge-dbs -n test-system {my-rtas}
 - c. Run the following command to remove the resources that were created during the migration process:

 migrate.sh delete-temp-resources -n test-system {my-rtas}

where {my-rtas} is the release name that you provided during the installation of the server software.

10. Run the following command to verify and test the installed server software:

```
$ helm test {my-rtas} -n test-system
```

where $\{my-rtas\}$ is the release name that you provided during the installation of the server software.

Results

On successful installation of Rational® Test Automation Server, the output displays the URL to access the Rational® Test Automation Server UI.

What to do next

You can perform the following tasks:

- Back up the user data that are saved in the Kubernetes clusters to secure your data. See Backing up and restoring the user data on Red Hat OpenShift on page 48.
- Configure the license to use Rational® Test Automation Server. See Configuring floating licenses on page 87.

Related information

Troubleshooting Guide on page 402

Installation of the server software on Ubuntu

You can find information about the tasks that you can perform to install Rational® Test Automation Server software on the Ubuntu platform.

Prerequisites for installing the server software on Ubuntu

You must first complete certain tasks before you install Rational® Test Automation Server on the Ubuntu platform.

The following sections describe each prerequisite in detail:

- Internet access on page 35
- Entitlement key on page 35
- Ubuntu server on page 35
- · Backup user data on page 36
- Mandatory software on page 36
- k3s environment on page 36
- Service virtualization through Istio on page 36

Internet access

You must have access to the internet to install Rational® Test Automation Server.

Entitlement key

You must copy an **Entitlement key** from Container software library to pull the images used by the server software. For more information, refer to Creating an API key.

Ubuntu server

You must install an Ubuntu server and ensure that you have a working Domain Name Server (DNS) that resolves the host name into a machine-readable IP address.

For more information about hardware and software requirements, see System Requirements on page 10.

Note: Depending on your testing workload, Rational® Test Automation Server might require more resources. You must use the entire disk space and set up Logical Volume Manager (LVM) by using the <code>ext4</code> file system. If your organization requires application data to be stored in a separate partition, then you can create a mount point at /var/lib/rancher/k3s/storage/ with at least 128 GB capacity.

Backup user data

If you want to migrate user data from a previous version of the product during the installation of the server software, then you must perform one of the following tasks based on the existing version of the server software:

- Back up the data from V10.0.2, Fix Pack 1 or earlier. See Backing up the user data from a previous release.
- Back up the data from V10.1.0 or later. See Backing up and restoring the user data on Ubuntu on page 50.

Note: You must select the existing version of Rational® Test Automation Server from the drop-down list to view the procedure for Backing up and restoring the user data for your version, as the instructions differ for versions 10.1, 10.1.1, and 10.1.2.

Mandatory software

You must install the following mandatory software:

• Helm V3.5.2. For more information, refer to the Helm documentation.

Note: The helm command must be in one of the directories in your PATH environment variable.

• OpenSSH Server. For more information, refer to the Installation section in the OpenSSH Server documentation.

Note: If you use ssh to log in to the computer, then you can skip this step as OpenSSH is already installed on your computer.

k3s environment

You must set up the k3s Kubernetes environment along with other configurations such as firewall, Jaeger, and Prometheus server. See Setting up a Kubernetes environment (k3s) on Ubuntu on page 37.

Service virtualization through Istio

Disclaimer: This release contains access to the Virtual services that virtualize the Istio based services feature in IBM® Rational® Test Automation Server as a Tech Preview. The Tech Preview is intended for you to view the capabilities for virtualized services offered by Rational® Test Automation Server, and to provide your

feedback to the product team. You are permitted to use the information only for evaluation purposes and not for use in a production environment. IBM provides the information without obligation of support and "as is" without warranty of any kind.

To provide your feedback, you can send an email to devops 24@us.ibm.com.

The default configuration does not enable service virtualization through Istio. To use the service virtualization feature, you must configure it appropriately. As a Tech Preview feature, you can virtualize the *bookinfo* sample application. You must install this application in the <code>Bookinfo</code> namespace. For more information about the *bookinfo* application, refer to the Istio documentation.

For more information about how to enable service virtualization through Istio, see Setting up a Kubernetes environment (k3s) on Ubuntu on page 37.

Setting up a Kubernetes environment (k3s) on Ubuntu

You can use the script that is provided with Rational® Test Automation Server to set up a k3s Kubernetes environment.

Before you begin

You must have completed the following tasks:

- · Installed the following software:
 - · OpenSSH server
 - Helm
- Ensured that your computer has a Domain Name Server (DNS) resolvable host name to resolve the host name into a machine-readable IP address.

About this task

As part of the k3s Kubernetes environment set up, you can enable the following software:

- Jaeger: By using this software, you can trace test logs and Jaeger-based reports when you run tests.
- **Prometheus server**: By using this software, you can monitor your system resources by using metrics data that are collected by a Prometheus server.
- 1. Use an SSH session to log in to the Ubuntu server.
- 2. Run the following command to retrieve the case from IBM Cloud Pack repository:

```
curl -o ibm-rtas-case-4.1013.0.tgz
https://raw.githubusercontent.com/IBM/cloud-pak/master/repo/case/ibm-rtas-case-4.1013.0.tgz
```

3. Run the following command to extract the case:

```
tar xvf ibm-rtas-case-4.1013.0.tgz
```

4. Run any of the following commands to install the k3s Kubernetes environment:

Note: The second option allows you to override the name of the Kubernetes domain that is created.

Choose from:

 Run the following commands to install with the default name that is either based on IP address or fully qualified host name:

```
#Run the following commands if you are on Ubuntu 18.04
$ cd ibm-rtas-case/inventory/ibmRtasBase/files
$ sudo ./ubuntu-init.sh

#Run the following commands if you are on Ubuntu 20.04
$ cd ibm-rtas-case/inventory/ibmRtasBase/files
$ sudo HOME=$HOME ./ubuntu-init.sh
```

• Run the following commands to install k3s Kubernetes environment by overriding the default name:

```
$ cd ibm-rtas-case/inventory/ibmRtasBase/files
$ sudo INGRESS_DOMAIN={rtas.}myorg.com HOME=$HOME ./ubuntu-init.sh
```

where:

• {rtas.} is a sub-domain name that you specified for the server. For example, testenv.

Note: The sub-domain must consist of lowercase alphanumeric characters, "-"(hyphen) or "."(period). Also, the value must start and end with an alphanumeric character.

myorg.com is the domain name of your organization. For example, ibm.com

You can access the product through a web browser by using any of the following ways:

- Fully Qualified Hostname: When the server is configured, you can use hostname -f command to get the fully qualified hostname defined in the DNS to access Rational® Test Automation Server. For example, rtas.myorg.com
- **IP address**: You can use the IP address to access Rational® Test Automation Server when you cannot create a specific DNS record for the server. For example, ip-address.nip.io

Result

On completion of the ubuntu-init.sh script, a namespace with the name test-system is created to install the server software and the output displays the following information on the command-line interface:

- The INGRESS_DOMAIN that is in use. This is, the URL from where you can access Rational® Test
 Automation Server. You must use this value for the global.ibmRtasIngressDomain parameter in step 5
 on page 41 in the server installation topic.
- The DNS information that the Kubernetes cluster uses to resolve names.

· Certificate Authority (CA) that must be import into the browser to prevent certificate errors.

You can run the following command to get the certificate from the system:

```
kubectl get secret ingress -n test-system -o jsonpath={.data.ca\\.crt} | base64 -d
```

• Instructions to confirm whether the Kubernetes environment has started.

You can refer to the **Results** section for more details on how to verify the Kubernetes environment has started.

5. Perform one of the following options to configure a firewall:

Choose from:

• Run the following script to configure the firewall that allows traffic on cni0 and port 443:

```
#Run the following command if you are on Ubuntu 18.04
$ sudo ./ubuntu-firewall.sh

#Run the following command if you are on Ubuntu 20.04
$ sudo HOME=$HOME ./ubuntu-firewall.sh
```

Note: You must consult your network administrator before you run this script and confirm that whether the firewall is compatible with your corporate policy.

- Update the firewall that allows traffic on *cni0* and port *443*, if your Ubuntu server is already configured with the firewall.
- 6. Optional: Run the following command to enable Istio service virtualization, a Tech Preview feature:

```
#Run the following command if you are on Ubuntu 18.04
$ sudo ./ubuntu-init.sh --demo

#Run the following command if you are on Ubuntu 20.04
$ sudo HOME=$HOME ./ubuntu-init.sh --demo
```

7. **Optional:** Run the following command to enable the Jaeger traces for performance and Web UI tests:

```
./service.sh expose jaeger
```

Note: If you do not enable Jaeger, Rational® Test Automation Server produces text output in a microservice log file instead of Jaeger traces when you run performance and Web UI test assets.

- **! Important:** The Jaeger traces are not protected, thus, any information logged into the Jaeger server might be easily accessible by anyone who has or discovers the *server-url>/jaeger* URL.
- 8. Optional: Run the following command to enable the Prometheus server to monitor your system resources by using metrics data:

./service.sh expose prometheus

Important: The Prometheus metrics are not protected, thus, any information logged into the Prometheus server might be easily accessible by anyone who has or discovers the <server-url>/prometheus URL.

Results

You have set up the Kubernetes environment on Ubuntu.

Note: You can run the kubectl get pods -A command to verify that the Kubernetes environment is working. After a while, the status of the pods must be Running or Complete state.

What to do next

- You must log in to the server host system again after the installation process is completed so that changes to the group membership are applied.
- You can install the server software. See Installing the server software on Ubuntu by using k3s on page 40.

Jaeger Operator

Prometheus server

Troubleshooting Guide on page 402

Installing the server software on Ubuntu by using k3s

You can install Rational® Test Automation Server on the Ubuntu server that has a Kubernetes environment to run functional, integration, and performance tests. Rational® Test Automation Server combines test data, test environments, and test runs and reports into a single, web-based browser for testers and non-testers.

Before you begin

You must have performed the following tasks:

- Completed tasks provided in the Prerequisites section. See Prerequisites for installing the server software on Ubuntu on page 35.
- Set up k3s Kubernetes environment. See Setting up a Kubernetes environment (k3s) on Ubuntu on page 37.
- · Logged in to the server host system again after the you completed the k3s environment setup.
- Copied the following values to be used during the installation process:

- The **Entitlement key** from the Container software library.
- The INGRESS_DOMAIN value that displayed on completion of the ubuntu-init.sh script.
- 1. Use an SSH session to log in to the Ubuntu server.
- 2. Add the entitlement registry to Helm to access the server install charts by running the following command:

```
helm repo add ibm-helm https://raw.githubusercontent.com/IBM/charts/master/repo/ibm-helm
```

3. Run the following command to get the latest updates from the repository:

```
helm repo update
```

4. Create a Secret to pull images that are used by Rational® Test Automation Server by running the following command:

```
kubectl create secret docker-registry cp.icr.io \
-n test-system \
--docker-server=cp.icr.io \
--docker-username=cp \
--docker-password={your_entitlement_key} \
--docker-email=example@abc.com
```

- You must substitute {your_entitlement_key} with the key that you copied from Container software library.
- \circ You can replace ${\tt example@abc.com}$ with the administrator email address, if required.
- 5. Perform the following steps to install the server software:
 - a. Run the following command to get the latest updates from the repository:

```
helm repo update
```

b. Run the following command to retrieve the charts required to install the server software:

```
helm pull --untar ibm-helm/ibm-rtas-prod --version 4.1013.0
```

c. Perform one of the steps described in the following table to install the server software based on your requirement:

Step description	Step no
To install the server software	Go to step 5.c.i on page 42
To install the server software and enable Istio service virtualization, a Tech Preview feature	Go to 5.c.ii on page 42

Step description	Step no
To install the server software and enable the Jaeger UI	Go to step 5.c.iii on
Note: You must perform this step only if you have not enabled the Jaeger UI to be exposed during the setting up of Kubernetes k3s environment.	page 42
To install the server software and enable performance test runs on the statuc agents	Perform 5.c.iv on page 43

i. Run the following command to install the server software:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-k3s.yaml \
--set global.ibmRtasIngressDomain={my-ingress-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address}
```

ii. Run the following command to install the server software and to enable Istio service virtualization, a Tech Preview feature:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-k3s.yaml \
--set global.ibmRtasIngressDomain={my-ingress-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address} \
-f ibm-rtas-prod/values-k3s-demo.yaml
```

Important: You must run the following command to enable service virtualization in the specific namespace after the server installation is complete:

```
kubectl create rolebinding istio-virtualization-enabled -n
bookinfo --clusterrole={my-rtas}-execution-istio-test-system
--serviceaccount=test-system:{my-rtas}-execution
```

Note: When you uninstall the chart, the manually created role bindings are not deleted from the namespace. You can run the following command to delete the role bindings:

```
kubectl delete rolebinding istio-virtualization-enabled -n bookinfo
```

iii. Run the following command to install the server software and to enable the Jaeger UI, if you have not enabled the Jaeger UI to be exposed during the setting up of Kubernetes k3s environment:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-k3s.yaml \
--set global.ibmRtasIngressDomain={my-ingress-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address} \
--set-string execution.annotations.sidecar\\.jaegertracing\\.io/inject=true \
--set global.jaegerAgent.enabled=true \
--set global.jaegerAgent.internalHostName=localhost \
--set global.jaegerDashboard.enabled=true \
--set global.jaegerDashboard.externalURL={my-jaeger-dashboard-url}
```

iv. Run the following command to install the server software and to enable performance test runs on the static agents:

```
helm install {my-rtas} ./ibm-rtas-prod -n test-system \
--set license=true \
-f ibm-rtas-prod/values-k3s.yaml \
--set global.ibmRtasIngressDomain={my-ingress-dns-name} \
--set global.ibmRtasPasswordAutoGenSeed={password-seed} \
--set global.ibmRtasRegistryPullSecret=cp.icr.io \
--set global.rationalLicenseKeyServer=@{rlks-ip-address} \
--set networkPolicy.enabled=false
```

You must substitute the value of the following variables with the actual value in the command:

• {my-rtas} with the release name of your choice.

Note: The release name must consist of lower case alphanumeric characters or "-" (hyphen), start with an alphabetic character, and end with an alphanumeric character. For example, *my-org* or *abc-123*.

- {my-ingress-dns-name} with the INGRESS_DOMAIN value that displayed on completion of the ubuntu-init.sh script.
- {password-seed} with a value of your choice.

Important: This password seed is used to create several default passwords for the server. You must store the password seed securely. When you install the server software by using the backup of the user data, you can reuse the password seed. You

can use this seed to restore backup files either on the current or later versions of the server software.

• Optional: {rlks-ip-address} with the IP address of Rational License Key Server, if you are setting the license value for the first time.

Important: If you are upgrading the product from the previous version, you must configure the **Rational License Key Server** value in the **License Configuration** window when the installation of the server is complete.

- {my-jaeger-dashboard-url} with the URL of the Jaeger server.
- 6. Optional: Run the following command to remove a job that is used to initialize the PostgresQL database during the installation of the server software:

```
kubectl delete job {my-rtas}-postgresql-init -n test-system
```

- 7. **Optional:** Perform the following steps to migrate data into Rational® Test Automation Server, if you upgraded the server software from the previous version:
 - a. Run the following script from the ibm-rtas-prod/files directory to create a directory that contains metadata related to the Persistent Volume Claims and their Persistent Volumes:
 migrate.sh create-pvcs -n test-system {my-rtas}
 - b. Run the following script from the ibm-rtas-case/inventory/ibmRtasBase/files directory to back up the data:

```
sudo backup.sh create-pvc-links -v ~/migration-pvc-links
```

c. Run the following command to stop the cluster and Rational® Test Automation Server:

k3s-killall.sh

d. Run the following script from the ibm-rtas-case/inventory/ibmRtasBase/files directory to restore the backed-up data:

```
sudo backup.sh restore -v ~/migration-pvc-links <backup-file-name> --release
```

Note: You must replace <backup-file-name> with the name of the back up file that you saved.

- e. Run the following command to restart Kubernetes and to start Rational® Test Automation Server:

 sudo systemctl start k3s
- f. Run the following script from the ibm-rtas-prod/files directory to merge the data into the server: migrate.sh merge-dbs -n test-system {my-rtas}
- g. Run the following command to remove the resources that were created during the migration process:

 migrate.sh delete-temp-resources -n test-system {my-rtas}

8. Run the following command to verify and test the installed server software:

```
$ helm test {my-rtas} -n test-system
```

where $\{my-rtas\}$ is the release name that you provided during the installation of the server software.

Results

On completion of the installation of server software, the output displays the following information on the command-line interface:

• Instructions to access Keycloak to manage and authenticate users.

You must use keycloak as user name and the password can be retrieved by running the following command:

```
kubectl get secret -n namespace rtas-keycloak-postgresql -o jsonpath="{.data.password}" | base64
    --decode; echo
```

where:

- rtas is a sub-domain name that you select for the server.
- namespace is the name of the namespace that you created.
- The URL to access the Rational® Test Automation Server UI.

What to do next

You can do the following tasks:

- Back up the user data that are saved in the Kubernetes clusters to secure your data. See Backing up and restoring the user data on Ubuntu on page 50.
- Configure the license to use Rational® Test Automation Server. See Configuring floating licenses on page 87.

Troubleshooting Guide on page 402

Server software upgrade methods

When you want to use the enhanced functionalities of Rational® Test Automation Server, you must upgrade to the latest version of the server software.

Server software upgrade on Red Hat OpenShift

When you want to use the latest version of the server software on Red Hat OpenShift, you must upgrade Rational® Test Automation Server from the previous version of the software.

Before you upgrade the server software, you must ensure that you have completed the following tasks:

- Installed Helm V3.5.2. For more information, refer to the Installing a Helm chart on an OpenShift Container Platform cluster section in the Red Hat OpenShift documentation.
- Informed users that Rational® Test Automation Server is offline temporarily during the upgrade process.
- Completed all test executions that are running on the existing Rational® Test Automation Server V10.1.0 or later.
- Stopped all stub executions that are running on the existing Rational® Test Automation Server V10.1.0 or later.
- Canceled any scheduled test runs that have a future date or time.

In upgrade (by new install) method, depending on the existing version of the software, you can upgrade the server software by using any of the following options.

To upgrade Rational® Test Automation Server V10.1.0 or later to latest version, you must perform these tasks in sequence as listed in the following table:

	Task description	More information
1	Uninstall Rational® Test Automation Server V10.1.0 or later.	Uninstalling the server software from Red Hat OpenShift on page 55
2	Install the latest version of the server software. Installing the server software on OpenShift on page 28	

To upgrade Rational® Test Automation Server V10.0.2, Fix Pack 1 or earlier to latest version, you must perform these tasks in sequence as listed in the following table:

Tasks	Task description	More information
1	Upgrade Rational® Test Automation Server V10.1.2. Installation of the server software of Hat OpenShift	
2	Uninstall Rational® Test Automation Server V10.1.2.	Uninstalling the server software
3	Install the latest version of the server software. Installing the server software on Recompensation of the server software.	

After you migrate the server data from a previous version to a newer version, the **Project Owner** must log in to Rational® Test Automation Server so that other members of the project can access the test assets in that project.

Server software upgrade on Ubuntu

When you want to use the latest version of the server software on Ubuntu, you must upgrade Rational® Test Automation Server from the previous version of the software.

Before you upgrade the server software, you must ensure that you have completed the following tasks:

- Installed Helm V3.5.2. For more information, refer to the Helm documentation.
- Informed users that Rational® Test Automation Server is offline temporarily during the upgrade process.
- Completed all test executions that are running on the existing Rational® Test Automation Server V10.1.0 or later.
- Stopped all stub executions that are running on the existing Rational® Test Automation Server V10.1.0 or later.
- Canceled any scheduled test runs that have a future date or time.

In upgrade (by new install) method, depending on the existing version of the software, you can upgrade the server software by using any of the following options.

To upgrade Rational® Test Automation Server V10.1.0 or later to latest version, you must perform these tasks in sequence as listed in the following table:

Tasks	Task description	More information
1	Back up the user data from Rational® Test Automation Server V10.1.0 or later.	 For V10.1.0, refer to Backing up user data - V10.1.0. For V10.1.1, refer to Backing up user data - V10.1.1. For V10.1.2, refer to Backing up user data - V10.1.2.
2	Uninstall Rational® Test Automation Server V10.1.0 or later.	Uninstalling the server software from Ubuntu on page 56
3	Install the latest version of the server software, and then restore the user data.	Installing the server software on Ubuntu by using k3s on page 40

If your existing version of server software is 10.0.2, Fix Pack 1, or earlier, then you cannot directly upgrade to the latest version of the server software due to the steps involved in the migration process. Therefore, you must perform the tasks in sequence as listed in the following table:

Tasks	Task description	More information
1	Upgrade Rational® Test Automation Server V10.1.2.	Installing Rational® Test Automation Server V10.1.2
2	Back up the user data from Rational® Test Automation Server V10.1.2.	Backing up user data - V10.1.2
3	Uninstall Rational® Test Automation Server V10.1.2.	Uninstalling the server software
4	Install the server software, and then restore the user data on the server software.	Installing the server software on Ubuntu by using k3s on page 40

Important:

After you migrate the server data from a previous version to a newer version, the **Project Owner** must log in to Rational® Test Automation Server so that other members of the project can access the test assets in that project.

Backing up and restoring the user data

You might want to restore an earlier environment state if you install a new version of Rational® Test Automation Server, move environments to different systems (both real and virtual), or set up a test environment ready for testing. To address any of these needs, you can back up and restore Rational® Test Automation Server user data installed either on Ubuntu or on Red Hat OpenShift platform.

Backing up and restoring the user data on Red Hat OpenShift

To secure the user data in IBM® Rational® Test Automation Server that is installed on the OpenShift server, you can back up the user data. At any point in time, after you install IBM® Rational® Test Automation Server, you can restore the backed-up user data.

Before you begin

You must have been granted access to the cluster.

About this task

This topic provides you with an example of backing up and restoring the user data by using Velero. Velero is one of the methods for backing up and restoring the user data. You can also use other methods for backing up and restoring the user data. If you use a different method to back up, then you must include the Persistent Volumes in the cluster.

Preparing your cluster to backup and restore the user data

You must prepare your cluster before you back up or restore the user data in Rational® Test Automation Server.

- 1. Log in to the cluster by using oc login.
- 2. Install and configure Velero with the Restic Integration.
- 3. Set the name of the namespace in which Rational® Test Automation Server is installed by running the following command:

```
NS=<namespace>
```

4. Update stateful sets to apply the annotations required by Velero to back up the PVs used by the pods by running the following commands:

```
for sts in $(oc get sts -n "$NS" -o name); do \
   if ! oc -n "$NS" patch --type=json "$sts" -p \
        '[{"op":"add","path":"/spec/template/metadata/annotations/backup.velero.io~lbackup-volumes",
        "value":"data"}]' 2>/dev/null; then
        oc -n "$NS" patch --type=json "$sts" -p \
              '[{"op":"add","path":"/spec/template/metadata/annotations",
        "value":{"backup.velero.io/backup-volumes":"data"}}]'
    fi \
done
```

5. Change the security restriction of the pods by running the following commands:

```
for sts in $(oc get sts -n "$NS" -oname); do \
   if oc get -n "$NS" "$sts" -ojsonpath='{.spec.template.spec.securityContext}' | grep -q
   "runAsNonRoot:true"; then \
     echo $sts
     oc patch -n "$NS" "$sts" --type json \
        -p '[{"op":"replace", "path":"/spec/template/spec/securityContext", "value":
   {"runAsNonRoot": false}}]'
   fi \
done
```

Backing up the user data

You can back up the user data by using Velero.

Before you begin

You must have completed the steps in the Preparing your cluster to backup and restore the user data on page 49.

About this task

This procedure is an example of backing up the user data by using Velero.

- 1. Log in to the cluster by using oc login.
- 2. Start the backup process by running the following commands:

```
velero backup create <backup-name> --include-namespaces=<ibm-rtas-namespace>
```

Restoring the user data

If you want to restore the Velero backup on to a cluster in which Rational® Test Automation Server is not installed, you can restore the user databy using Velero.

Before you begin

You must have backed up the user data. See Backing up the user data on page 49.

- 1. Log in to the cluster by using oc login.
- 2. Start the restore process by entering the following command:.

```
velero restore create --from-backup=<backup-name> --restore-volumes
```

Results

You have backed up or restored the user data for Rational® Test Automation Server.

What to do next

After you migrate the server data from a previous version to a newer version, the **Project Owner** must log in to Rational® Test Automation Server so that other members of the project can access the test assets in that project.

Persistent storage on page 27

Velero Documentation

Backing up and restoring the user data on Ubuntu

To secure the user data in Rational® Test Automation Server that is installed on the Ubuntu server, you can back up the user data. At any point in time, after you install Rational® Test Automation Server, you can restore the backed-up user data.

Before you begin

You must have completed the following tasks:

- Been granted with the same permissions that are required for installing and uninstalling the software.
- Been granted with the sudo access.
- Communicated to the users that Rational® Test Automation Server might be unavailable for some time until the process is complete.

About this task

You may need to back up and restore the user data in the following scenarios:

- Move the existing environment to a new system.
- Change the release name or the namespace.
- Back up the user data at regular intervals and restore the backed-up data when required.

Backing up the user data

You can back up the user data in Rational® Test Automation Server and use the backed-up data to restore at any point in time.

- 1. Log in to the Ubuntu server and open a terminal.
- 2. Run the following command to retrieve the case from IBM Cloud Pack repository:

```
curl -o ibm-rtas-case-4.1013.0.tgz
https://raw.githubusercontent.com/IBM/cloud-pak/master/repo/case/ibm-rtas-case-4.1013.0.tgz
```

3. Run the following command to extract the case:

```
tar xvf ibm-rtas-case-4.1013.0.tgz
```

4. Change to the ibm-rtas-case/inventory/ibmRtasBase/files directory.

This directory contains the backup.sh script which is required to complete the backup operation.

5. Create a directory that contains metadata related to the Persistent Volume Claims and their Persistent Volumes by running the following command:

```
sudo ./backup.sh create-pvc-links
```

You can use the following optional parameter along with the create-pvc-links command:

--volumes or -v: Use this parameter to specify the directory path of the Volumes.

For example, backup.sh create-pvc-links -v ibm-rtas-case/inventory/ibmRtasBase/files/my-pvc-links creates a directory called my-pvc-links that stores the metadata required for backup.

Remember:

- If you did not provide the volume parameter, by default, the command creates a sub-directory in the same directory where you have the backup script.
- You must ensure that the directory you create must be empty or not exist to avoid script failure.
- If you specify a directory by using the -v parameter, then you must use the same parameter value when you restore the data.
- 6. Run the following command to stop the cluster and Rational® Test Automation Server:

k3s-killall.sh

7. Run the following command to create a backup of the existing user data:

```
sudo ./backup.sh create [options] <backup-file-name>
```

After you run this command, a backup of the local Persistent Volumes is created. The backup is created as tar archives that is compressed by using gzip (.tar.gz). The **create** command archives the Persistent Volumes into the *<backup-file-name>*.

You can use the following parameters along with the create command:

-namespace or -n: Use this parameter to back up the Persistent Volumes in the specified namespace.
 If you do not mention the namespace, then all the Volumes from all the namespaces are included in the backup. The syntax is:

```
-namespace <name of the namespace>
```

• -volumes or -v: Use this parameter to specify the directory path of the Volumes. The syntax is:

```
-volumes <path-of-the-directory>
```

Remember:

- If you did not provide the volume parameter, by default, the command creates a subdirectory in the same directory where you have the backup script.
- If you specify a directory by using the -v parameter, then you must use the same parameter value when you restore the data.

For example,

```
sudo ./backup.sh create --namespace test-system my-backup.tar.gz
```

This command creates a backup file named *my-backup.tar.gz* that contains all of the Persistent Volumes associated with pods available in the *test-system* namespace.

8. Run the following command to restart the cluster and Rational® Test Automation Server:

```
sudo systemctl start k3s
```

Restoring the user data

You can restore the user data that is backed up in Rational® Test Automation Server at any point in time after you install latest version of server software.

About this task

The following procedure is for the restoration of the server data from the current release. If you are upgrading the server software, then you can restore the server data from the earlier version to the latest version during the installation of the server software. For more information, see the **Related information** section.

- 1. Log in to the Ubuntu server and open a terminal.
- 2. Run the following command to retrieve the case from IBM Cloud Pack repository:

```
curl -o ibm-rtas-case-4.1013.0.tgz
https://raw.githubusercontent.com/IBM/cloud-pak/master/repo/case/ibm-rtas-case-4.1013.0.tgz
```

3. Run the following command to extract the case:

```
tar xvf ibm-rtas-case-4.1013.0.tgz
```

4. Change to the ibm-rtas-case/inventory/ibmRtasBase/files directory.

This directory contains the backup.sh script which is required to complete the restore operation.

5. If you have not already done so, create a directory that contains metadata related to the Persistent Volume Claims and their Persistent Volumes by running the following command:

```
sudo ./backup.sh create-pvc-links
```

You can use the following optional parameter along with the create-pvc-links command:

--volumes or -v: Use this parameter to specify the directory path of the Volumes.

For example, backup.sh create-pvc-links -v ibm-rtas-case/inventory/ibmRtasBase/files/my-pvc-links creates a directory called my-pvc-links that stores the metadata required to restore your user data.

Remember:

- If you did not provide the volume parameter, by default, the command creates a sub-directory in the same directory where you have the backup script.
- You must ensure that the directory you create must be empty or not exist to avoid script failure.
- 6. Run the following command to stop the cluster and Rational® Test Automation Server:

```
k3s-killall.sh
```

7. Run the following command to restore the backed-up user data:

```
sudo ./backup.sh restore [options] <backup-file-name>
```

The restore command overwrites the existing Persistent Volumes with data from the

backup-file-name.

You can use the following parameters along with the restore command:

-namespace or -n: Use this parameter to restore a specific namespace from the backup file. If you do
not mention the namespace, then volumes from all the namespaces in the backup file are restored.
 You can map one namespace to another namespace by using colon (:). The syntax is:

```
--namespace <name of the namespace> [:<target-namespace>]
```

--release or -r: Use this parameter if the helm release name of the server to which the backup is being
restored is different than the helm release name of the server where the backup was taken. The syntax
is:

```
--release <backup-release>:<target-release>
```

• -volumes or -v: Use this parameter to specify the directory path of the Volumes. The syntax is:

```
--volumes <path-of-the-directory>
```

• -k or --confirm: Use this parameter to skip the confirmation step.

For example,

```
sudo ./backup.sh restore --namespace test-system:new-test-system -r rel-1:rel-2 -k my-backup.tar.gz
```

This command restores the volumes that are backed up from the *rel-1* release in the *test-system* namespace to the *rel-2* release in the *new-test-system* namespace and skips the confirmation step.

8. Run the following command to restart the cluster and Rational® Test Automation Server:

```
sudo systemctl start k3s
```

- The cluster and Rational® Test Automation Server might take some time to restart and until that time, you cannot access the Rational® Test Automation Server URL.
- You can run the kubectl get pods -A command to verify that the Kubernetes environment is
 working. After a while, the status of the pods must be Running state.

Results

You have backed up or restored the user data for Rational® Test Automation Server.

What to do next

After you migrate the server data from a previous version to a newer version, the **Project Owner** must log in to Rational® Test Automation Server so that other members of the project can access the test assets in that project.

Related information

Server software upgrade on Ubuntu on page 47

Uninstallation of the server software

When you no longer require Rational® Test Automation Server, you can uninstall the server software. You can uninstall the server software depending on the platform on which you installed the server software.

Uninstalling the server software from Red Hat OpenShift

When you want to install a new version of server software or to reinstall when an installation fails, you can uninstall the server software and its components from the Red Hat OpenShift platform.

Before you begin

You must have completed the following tasks:

- Installed Rational® Test Automation Server software.
- Closed Rational® Test Automation Server, any open web browsers, and all other applications that are enabled by Rational® Test Automation Server.
- Optional: Backed up data from the previous version of the product.
- 1. Open and log in to the terminal.
- 2. Run the following command to stop the workload that is running:

```
oc delete all,cm,secret -lexecution-marker -n test-system
```

Remember: test-system is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the test-system in all the instances in this procedure.

3. Run the following command to uninstall the server software:

```
helm uninstall {my-rtas} -n test-system
```

The PersistentVolumeClaims and PersistentVolumes that were created during the installation are not deleted automatically. If you reinstall the server software, the user data is reused unless you specifically delete those volumes.

Note: You must substitute $\{my-rtas\}$ with the same release name that you used during the installation of the server software.

4. Run the following command to delete everything including user data contained in PersistentVolumeClaims and PersistentVolumes:

oc delete project test-system

Important: If you want to migrate data from a previous version to the latest version of the product, then you must have taken the backup of data before you run this command.

Results

You have uninstalled the server software from the Red Hat OpenShift platform.

Uninstalling the server software from Ubuntu

When you want to install a new version of server software or to reinstall when an installation fails, you can uninstall the server software and its components from the Ubuntu platform.

Before you begin

You must have completed the following tasks:

- Installed Rational® Test Automation Server software.
- Closed Rational® Test Automation Server, any open web browsers, and all other applications that are enabled by Rational® Test Automation Server.
- Optional: Backed up data from the previous version of the product.
- 1. Use an SSH session to log in to the Ubuntu server.
- 2. Run the following command to stop the workload that is running:

```
kubectl delete all,cm,secret -lexecution-marker -n test-system
```

Remember: test-system is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the test-system in all the instances in this procedure.

3. Run the following command to uninstall the server software:

```
helm uninstall {my-rtas} -n test-system
```

The PersistentVolumeClaims and PersistentVolumes that were created during the installation are not deleted automatically. If you reinstall the server software, the user data is reused unless you specifically delete those volumes.

Note: You must substitute $\{my-rtas\}$ with the same release name that you used during the installation of the server software.

4. Run the following commands to delete the entire Kubernetes environment, including all user data:

```
#Run the following command if you are on Ubuntu 18.04
cd ibm-rtas-case/inventory/ibmRtasBase/files
sudo ./ubuntu-wipe.sh --confirm

#Run the following command if you are on Ubuntu 20.04
cd ibm-rtas-case/inventory/ibmRtasBase/files
sudo HOME=$HOME ./ubuntu-wipe.sh --confirm
```

After you run this command, the system returns to the same state as if <code>ubuntu-init.sh</code> was never run.

Important: If you want to migrate data from a previous version to the latest version of the product, then you must have taken the backup of data before you run this command.

Results

You have uninstalled the server software from the Ubuntu platform.

Configuration of the server software

You can find information about the tasks that you must perform after you installed the server software to configure Rational® Test Automation Server.

The following table describes the tasks that you can perform as an administrator after you installed the server software:

Require- ment	Tasks	More information
Required	Review the default user management to know how the server software manages the users and their authentication.	User administration on page 57
Required	Import Certificate Authority (CA) into a browser to prevent certificate errors when you access the Rational® Test Automation Server UI.	Importing Certificate Authority into a browser
Optional	Copy the third-party application Jars to Kubernetes to run API Suites that uses a transport.	Copying third-party application Jars to Kubernetes on page 73
Optional	Change the password seed to provide enhanced security to Rational® Test Automation Server.	Changing the password seed on page 75

User administration

After you install IBM® Rational® Test Automation Server, you must consider how the software manages users and authentication.

You can review the default user management provided by the server and decide what additional controls you might want to add. If you manage users and authentication through an existing LDAP/AD server, you can review how to use that server to manage Rational® Test Automation Server users.

Default user administration

You installed IBM® Rational® Test Automation Server and you want to know about how the software manages user access.

Rational® Test Automation Server uses Keycloak V9.0.2 (https://www.keycloak.org/) to manage and authenticate users.

If you manage and authenticate users by using an LDAP and Active Directory server, you can configure Keycloak to connect to that server. For more information, see LDAP user administration on page 60.

Keycloak uses the concept of a realm to manage and authenticate users. When you install the server software, a realm called testserver is created for you in Keycloak. All server users belong to this realm and when they log in to the server, they log into that realm.

As an administrator, it is important to consider the following points about the server administration:

- By default, there is no administrator for Rational® Test Automation Server.
- Such an administrator is required for accessing additional functions, which includes claiming ownership of server projects and unarchiving them. But you can assign administrative privileges to any user. You must do this by adding the admin role to the user in Keycloak.
- You must sign up a user that you want to be the administrator. You must go to the Login page at https://
 <fully-qualified-dns-name>:443 and sign up.

Note: Do not use that admin user to perform non-administration tasks. Instead, sign up another user.

• After you sign up the user that you want to be the administrator for Rational® Test Automation Server, you must log in to the Keycloak Admin Console at https://<fully-qualified-dns-name>:443/auth/admin/ to make that user the server administrator.

The default user name for the Keycloak administrator is keycloak. The password is randomly generated when the software is installed. You can see the password by using the following kubectl command:

```
kubectl get secret -n test-system {my-rtas}-keycloak-postgresql -o jsonpath="{.data.password}" | base64 --decode; echo
```

Note: You must substitute {my-rtas} with the release name of your choice.

After you log in to the Keycloak Admin Console, from the Users page, you can search and select the user that you want to make an administrator. From the **Groups** tab, you can join the user to the **Admins** group.

For more information about assigning user roles, see Groups in the Keycloak documentation.

Now that you are the server administrator, it is important to consider the following points about the default user management and authentication:

- Minimum password length defaults to 8 characters
- · Email verification of new users is turned off
- The Forgot Password feature is turned on by default but no instructions are sent to the user to reset their password
- Forgotten user passwords are changed by you if you do not enable Keycloak to send instructions to reset a password

You can review the following sections about changing the default authentication controls.

Email settings

By default, the testserver realm sets the Forgot Password switch on. However, as an administrator, you must enable Keycloak to send an email to the user with instructions to reset their password. If you want to verify an email, you must also enable Keycloak to send an email to the user to verify their email address.

You must provide SMTP server settings for Keycloak to send an email. After you log in to the Keycloak Admin Console, see Email Settings in the Keycloak documentation.

Then, to set up the email verification, see Forgot Password in the Keycloak documentation.

Password policy

By default, the testserver realm has a password policy where the minimum length of a password is 8. As an administrator, you can update password policies in Keycloak.

After you log in to the Keycloak Admin Console, see Password Policies in the Keycloak documentation.

User password

If you did not enable Keycloak to send instructions to a user about how to reset a password, you must use the Keycloak Admin Console to change their password for them.

After you log in to the Keycloak Admin Console, see User Credentials in the Keycloak documentation.

User deletion

When a user is inactive or no longer needs to access the server, you can delete that user.

After you log in to the Keycloak Admin Console, see Deleting Users in the Keycloak documentation.

LDAP user administration

You installed IBM® Rational® Test Automation Server and you are using a Lightweight Directory Access Protocol and Active Directory HTTP server to manage users and authentication. You want to know the best practices to use that LDAP/AD server to manage user access to Rational® Test Automation Server.

Rational® Test Automation Server uses Keycloak V9.0.2 (https://www.keycloak.org/) to manage and authenticate users.

Existing user databases hold user credentials. Keycloak federates these existing external user databases through the concept of storage providers. By default, Keycloak supports an LDAP and Active Directory storage provider. By adding a storage provider, you can map LDAP user attributes into Keycloak. You can also configure more mappings.

Before you configure Keycloak to use an existing LDAP/AD provider, you must consider the following best practices:

- Set up your LDAP/AD provider as a read-only repository so that Rational® Test Automation Server cannot change it.
- Add and remove users in LDAP/AD and not the Keycloak local user database.
- Import and synchronize your LDAP/AD users to your Keycloak local database.
 - An import for an LDAP/AD user can fail if the LDAP/AD field chosen for the username mapping in Keycloak is not filled in for that user in LDAP/AD.
 - Filter LDAP/AD users by using the Custom User LDAP Filter, so you can import a subset of all your LDAP users. For example, you can set up a Server user group in LDAP and only import those users to Keycloak.
- Map a login style name, for example, userl@server.com, by using the UserPrincipalName attribute in LDAP/AD to a username in Keycloak. If you want the full name of the user as your login style, use the cn attribute in LDAP/AD.

Note: The LDAP/AD user name attribute must match the LDAP/AD provider user name attribute (**Username LDAP attribute**) in Keycloak for the LDAP/AD provider to connect with Keycloak.

The following sections use these best practices to guide you to set up Keycloak to connect to your LDAP/AD HTTP server.

LDAP provider selection in Keycloak

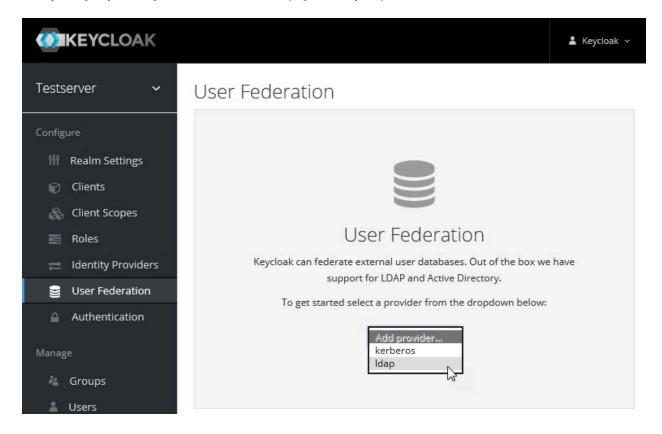

You can use the Keycloak Admin Console to add an LDAP/AD provider.

You can log in to the Keycloak Admin Console at https://cfully-qualified-dns-nam-/auth/admin. The default user name for the Keycloak administrator is keycloak. The password is randomly generated when you installed the IBM® Rational® Test Automation Server software. You can see the password by using the following kubectl command:

Note: You must substitute {my-rtas} with the release name of your choice.

After you log in, you can go to the User Federation page to add your provider.

You want to select the provider named **Idap** from the list. From the Add User Federation Provider page, you can use a form to complete your LDAP/AD connection parameters.

Required settings for a successful connection to your LDAP/AD provider

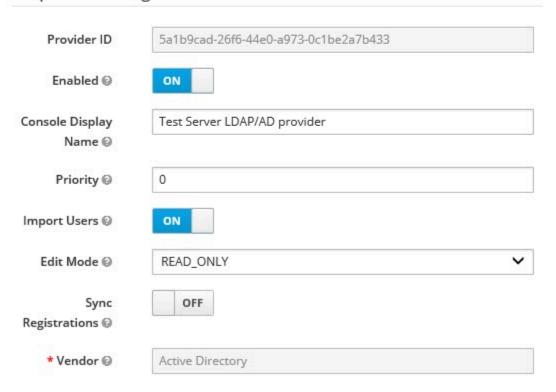

The form includes many fields and several fields include default values. Tables describe the important fields that you must complete to ensure a successful HTTP connection to your LDAP/AD provider.

User Federation > Test Server LDAP/AD Provider

Test Server LDAP/AD Provider

Settings Mappers

Required Settings

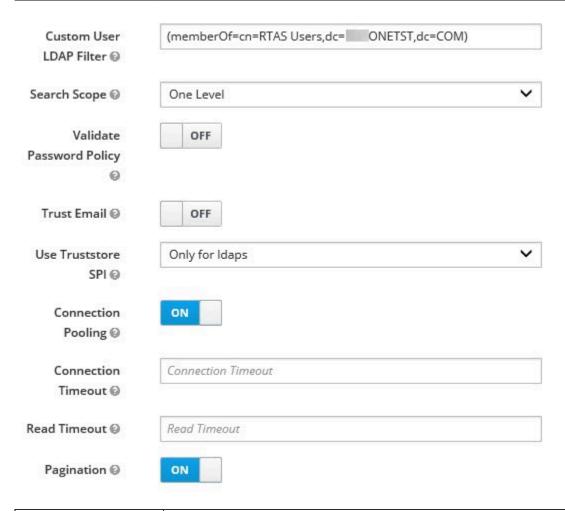

Field	Description
Console Display Name	You want to make your console name recognizable, for example, Test Server LDAP/AD Provider. This name is shown in the Keycloak Admin Console.
Priority	The priority must be set to 0 so that when a user logs in to Rational® Test Automation Server, Keycloak looks up the user first in the list of users managed in the LDAP/AD user database. If the user is not found in your LDAP/AD user database, Keycloak then looks up the user in the local Keycloak user database.
Import Users	You want to leave import users ON so that users in your LDAP/AD user database are synchronized (imported) automatically into the Keycloak local user database. The import uses the settings that you are defining now. After the initial import, when you add a user to your LDAP/AD user database and that user logs in to Rational® Test Automation Server, the LDAP/AD provider imports the

Field	Description	
	LDAP/AD user into the Keycloak user database and authenticates the user against the	
	LDAP/AD password.	
	Similarly, after the initial import, when you remove a user from your LDAP/AD user data-	
	base that user cannot log in to Rational® Test Automation Server.	
	Note: For consistent user management, continue to manage users in your LDAP/ AD user database.	
Edit Mode	Make sure that edit mode is set to READ_ONLY .	
	This setting means that your LDAP/AD user database is read only. No user data defined	
	through the mapping of attributes in Keycloak such as the username is written back from	
	the Keycloak user database to your LDAP/AD user database.	
	This read-only setting also means that a new user cannot sign up from Rational® Test	
	Automation Server as no user data can be written to your LDAP/AD user database.	
Vendor	You want to select Active Directory from the list of vendors. Many fields complete with	
	default values based on this selection.	

		-	
* Username	userPrincipalName		
LDAP attribute ②			
* RDN LDAP	cn		
attribute ②			
* UUID LDAP	objectGUID		
attribute 🕝			
* User Object	User		
Classes ②			
* Connection	Idap://1012		Test connection
URL @			
* Users DN @	cn=Users,dc= ONETST,dc=COM		
* Bind Type ②	simple	~	
Enable StartTLS	OFF		
0			
* Bind DN @	RITAdmin		
* Bind Credential	******	(4)	Test authentication
0			

Field	Description	
Username LDAP attribute	You can use the default value on for the username, which is first name, last name, or you can use userPrincipalName, which is username@domain.	
	You might want a login that matches your company style. For example, you might prefer joetester@mycompany.com instead of Joe Tester.	
	If you do make this change the username that you specify now must match the username in the Mapper. Keycloak makes this change for you.	
User Object Classes	Because LDAP user records are found based on a user object class, you must set the User Object Classes to User.	
Connection URL	So that Keycloak can connect to your LDAP/AD user database, you must enter your LDAP/AD URL, for example, <a href="ldap://<hostname>.<domain>">ldap://<hostname>.<domain></domain></hostname> Make sure that you test the connection and confirm that the connection is successful.	
Users DN	You must provide the directory where the LDAP users are listed, for example, cn=User-s,dc=MYCOMPANY,dc=COM.	

Field	Description	
Bind DN	You must also provide the LDAP/AD user database administrator user ID for BIND DN	
Bind Credential	and password for the BIND Credential . These credentials are used by Keycloak to access the LDAP/AD user database.	
	Make sure that you test the authentication and confirm that the authentication is successful.	

Field	Description
Custom User LDAP Filter	You can filter your LDAP/AD users to import a subset of all your LDAP users.
	For example, you can set up a testers user group for your LDAP/AD user database such that only those users are imported to Keycloak.
	(memberOf=cn=TESTERS,dc=MYCOMPANY,dc=COM)

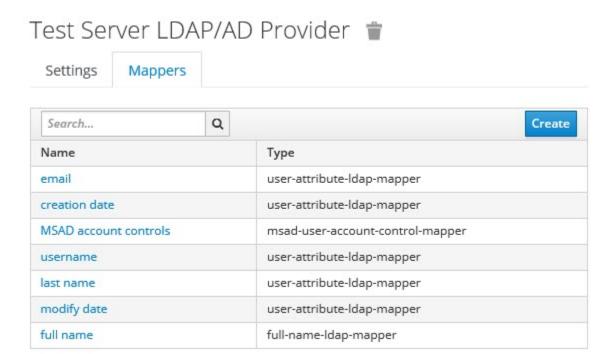

Field	Description
Batch size	You can change the number of users to import in a single transaction by using the batch size.
Cache Policy	If you have many users or performance concerns, you can change the cache policy to no cache.

You can save the settings, which creates your LDAP/AD provider.

Mappers

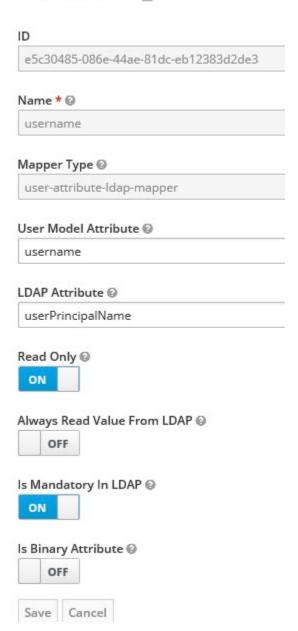

Keycloak uses mappers to map the user attributes defined in the Keycloak user model such as **username** and **email** to the corresponding user attributes in the LDAP/AD user database. By default, when you saved your settings and created your LDAP/AD provider, the following mappers were created.

The username attribute that you specified in the **Username LDAP attribute** must match the **username** t attribute defined in the Keycloak mapper for the LDAP/AD user database to connect with Keycloak.

Because you changed the **Username LDAP attribute** from the default value on to userPrincipalName, Keycloak made the same change in the mapper called **username** to match.

Username *

User synchronization

You must import all users from your LDAP/AD user database by using the option to **Synchronize all users**. Users are imported based on your saved settings when you set up your LDAP/AD provider.

Remove imported

Cache Settings Cache Policy NO_CACHE

Synchronize changed users

Save

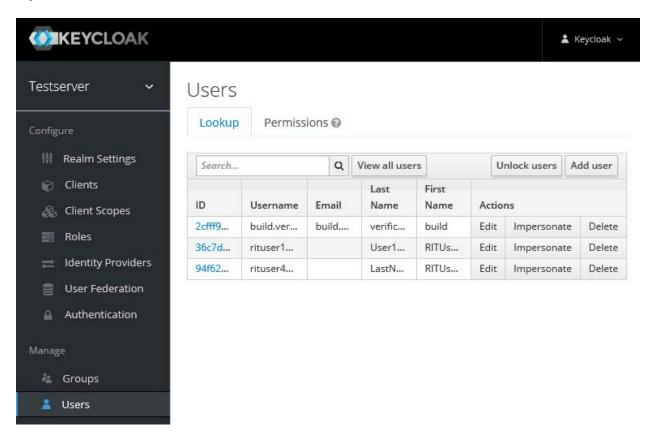

Unlink users

Cancel

A successful import is followed by a success message with the number of users imported. A failed import typically results when there is a mismatch between user attributes in the Keycloak user database and the LDAP/AD user database.

Synchronize all users

You can view all the LDAP/AD database users that were imported and authenticated from the Users page in the Keycloak Admin Console.

Users are listed with ID, Username, Email, Last Name, and First Name. The ID is generated by Keycloak. The value of the other attributes is fetched from the LDAP/AD user database by using mappers.

Managing account settings

You might want to change your password or other settings for your account.

About this task

As an account owner, you can view your account settings, which include your user name, email, and first and last name. You can also change all of these settings except the user name. Changing your password is also possible from your account settings.

Note: Account settings cannot be changed if IBM® Rational® Test Automation Server was configured to use an LDAP/AD provider. For more information about server security, see the related links.

- · Edit your account details by following these steps:
 - 1. Click the **User** icon (2) from the menu bar, and select **Account Settings**.

The Edit account page is displayed.

- 2. Edit your user details and save the changes. You can also reset your changes. If you cancel your changes, you return to the Home page.
- · Change your password by following these steps:
 - 1. Click the **User** icon (2) from the menu bar, and select **Account Settings**.

The Edit account page is displayed.

2. Click Change password.

The Change password page is displayed.

- 3. Type your current password followed by your new password
- 4. Confirm the new password by typing it again and save the changes. You can also reset your changes. If you cancel your changes, you return to the Home page.

Default user administration on page 58

Certificate authority: Importing and extending lists

When you want browsers and other applications to access Rational® Test Automation Server, you must enable browsers to trust the certificate authority (CA) of Rational® Test Automation Server. For some applications that integrate with Rational® Test Automation Server, you must also extend the CA lists that are trusted by the applications.

You can find the following tasks to import the certificate authority in the browser that you want to use:

- Importing Certificate Authority into the Google Chrome browser on page 71
- Importing Certificate Authority into the Microsoft Edge browser on page 71
- Importing Certificate Authority into the Mozilla Firefox browser on page 72

Importing Certificate Authority into the Google Chrome browser

You must import certificate authority into the Google Chrome browser to prevent certificate errors when accessing the Rational® Test Automation Server UI.

Before you begin

You must have completed the following tasks:

· Saved a certificate authority (CA) during the installation of Rational® Test Automation Server.

You can run the following command to get the certificate from the system:

```
kubectl get secret ingress -n test-system -o jsonpath={.data.ca\\.crt} | base64 -d
```

Remember: *test-system* is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the *test-system*.

- Installed the browser that you want to use to access Rational® Test Automation Server.
- 1. Open a Google Chrome browser.
- 2. Navigate to Customize and control Google Chrome > Settings.
- 3. Click Security from the Privacy and security pane.
- 4. Click Manage certificates, and then Import.
- 5. Click Next in the Certificate Import Wizard window.
- 6. Click **Browse** and select the CA that you want to import, and then click **Next**.
- 7. Select the Place all certificates in the following store option to store the CA securely.
- 8. Click Browse, and then select Trust Root Certification Authorities as certificate store.
- 9. Click OK, and then Finish.

Results

You have imported the CA into the Google Chrome browser.

Importing Certificate Authority into the Microsoft Edge browser

You must import Certificate Authority (CA) into the Microsoft Edge browser to prevent certificate errors when accessing the Rational® Test Automation Server UI.

Before you begin

You must have completed the following tasks:

· Saved a certificate authority (CA) during the installation of Rational® Test Automation Server.

You can run the following command to get the certificate from the system:

```
kubectl get secret ingress -n test-system -o jsonpath={.data.ca\\.crt} | base64 -d
```

Remember: *test-system* is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the *test-system*.

- Installed the browser that you want to use to access Rational® Test Automation Server.
- 1. Type certmgr.msc in the Start menu Search filed, and then press Enter.
- 2. Expand Trusted Root Certification Authorities, and then select Certificate.
- 3. Right-click on the empty space, and then select All tasks > Import.
- 4. Click Next in the Certificate Import Wizard window.
- 5. Click Browse and select the CA that you want to import, and then click Next.
- 6. Select the Place all certificates in the following store option to store the CA securely.
- 7. Click Browse, and then select Trust Root Certification Authorities as certificate store.
- 8. Click Next, and then Finish to import the certificate.

Results

You have imported the CA into the Microsoft Edge browser.

Importing Certificate Authority into the Mozilla Firefox browser

You must import Certificate Authority (CA) into the Mozilla Firefox browser to prevent certificate errors when accessing the Rational® Test Automation Server UI.

Before you begin

You must have completed the following tasks:

Saved a certificate authority (CA) during the installation of Rational® Test Automation Server.

You can run the following command to get the certificate from the system:

```
kubectl get secret ingress -n test-system -o jsonpath={.data.ca\\.crt} | base64 -d
```

Remember: *test-system* is the name of the namespace. If you created a namespace by using a different value, then you must use that value in place of the *test-system*.

- Installed the browser that you want to use to access Rational® Test Automation Server.
- 1. Open a Mozilla Firefox browser.
- 2. Enter "about:preferences#privacy" in the address bar, and then press Enter.
- 3. Locate and click the View Certificates option.

- 4. Select Authorities tab, and then click Import.
- 5. Select the CA that you want to import, and then click Open.
- Select Trust this CA to identify websites in the Downloading Certificate window.
- 7. Click **OK** to import the CA into the browser, and then close the window.
- 8. Restart Firefox.

Results

You have imported the CA into the Mozilla Firefox browser.

Copying third-party application Jars to Kubernetes

You can run API Suites in a project on Rational® Test Automation Server. If the API Suite uses a transport and the transport requires third-party application Jar files for a successful run, you must ensure that the third-party application Jar files are available at the test run time. To achieve this, you must copy the third-party application Jar files to the computer where Rational® Test Automation Server is installed on Kubernetes.

Before you begin

If you want to copy the third-party application Jar files to the remote Docker host, see Copying third-party application Jars to a remote Docker host on page 151.

You must have server administrator or cluster administrator privileges.

You must have completed the following tasks:

- Identified the third-party application Jar files that are required and copied the files. See Test run considerations for API Suites on page 134.
- Copied the third-party application Jar files from Rational® Integration Tester to the directory or folder in Kubernetes from where you can run the kubectl commands.

About this task

You can copy the third-party application <code>Jar</code> files to the folder that is specific for the application under the <code>/data/<application_name></code> folder. You need not extract the files.

You can perform this task any time after you have installed Rational® Test Automation Server and you plan to run an API Suite that meets any of the following conditions:

- The API Suite uses transports and the transports require third-party application Jar files to be available at the test run time.
- The API Suite in the project has a results database configured.

You can get help on the kubectl commands by running the command: kubectl cp --help from the /kube directory. For more information, refer to the kubectl documentation.

1. Use the following table to find the name of the folder that corresponds to the specific third-party application for the transport used in the API Suite.

Table 2. Name of the folder for the application

Application	Name of the folder to use
Camel	Camel
CentraSite	CentraSite
CICS	CICS
Coherence	Coherence
Database	JDBC
IMS	IMS
Integra	Integra
JMS	JMS
SAP RFC	SAP
Software AG Universal Messaging	SoftwareAGUM
TIBCO EMS	TIBCO
TIBCO Rendezvous	
TIBCO SmartSockets	
WebSphere Application Server Service Integration Bus (SiBus)	WAS
WebLogic	WebLogicJMX
Software AG webMethods	webMethods
WebSphere MQ	WMQ

2. Open the command prompt from the /kube directory and copy the Jar files to the folder that corresponds to the application by using the following command:

```
kubectl cp <compressed_files> test-system/{my-rtas}-userlibs-0:/data/<application_name>/
```

For example, if you are copying the Database Jar files, then the name of the folder is *JDBC* and the command to use is:

 $kubectl\ cp\ mysql-connector-java.jar\ test-system/\{my-rtas\}-userlibs-0:/data/JDBC/$

Note: You must substitute $\{my-rtas\}$ with the release name of your choice.

3. Verify whether the Jar files are copied by running the following command:

```
kubectl\ exec\ \{ \tt my-rtas \} - userlibs-0\ -n\ test-system\ --\ ls\ /data/< folder\_created >-- ls\ /data/< folder\_created
```

For example, if you copied the Database Jar files, mysql-connector-java.jar to the folder JDBC, then the command to verify is:

```
kubectl exec {my-rtas}-userlibs-0 -n test-system -- ls /data/JDBC
```

The following information is displayed for the JDBC folder:

```
mysql-connector-java.jar
```

Note: You must substitute $\{my-rtas\}$ with the release name of your choice.

Results

You have successfully copied the third-party application Jar files to the folder in Kubernetes.

What to do next

You can configure the API Suite run. See Configuring an API Suite run on page 171.

Changing the password seed

As an administrator, you can change the password seed that is used when you install the server software to provide enhanced security to Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Installed Rational® Test Automation Server. See Installation of the server software on page 25.
- Installed the JSON command-line tool, jq, and ensured that the jq is in your environment PATH. For information about jq, refer to jq documentation.
- Installed the Curl command line tool. For more information refer to curl documentation.

About this task

When you install Rational® Test Automation Server, you supply a password seed when you run the helm install command. This password seed is used to generate several Kubernetes secrets. Kubernetes Secrets can contain the following information:

- The authentication credentials for micro-services.
- An encryption key for the user-created secrets collection or other secrets.

When you change the password seed for Rational® Test Automation Server, you must consider the following scenarios:

- Rational® Test Automation Server cannot communicate until you reconcile the passwords which are in Kubernetes Secrets by using the old and a new password seed.
- Users cannot read secret collections or other secrets that they have created in Rational® Test Automation Server until you re-encrypt them using a new password seed.

Important: You must provide an offline token and old password seed that you used during the installation of server software to re-encrypt user secrets.

1. Run the following command to change the password seed for Rational® Test Automation Server:

```
helm upgrade {my-rtas} ./ibm-rtas-prod -n test-system \
--reuse-values \
--set global.ibmRtasPasswordAutoGenSeed={my-new-super-secret}
```

Notes: You must substitute the value of the following variables with the actual value in the command:

- {my-rtas} with the release name that you used during the installation of the server software.
- {my-new-super-secret} with a new value of your choice as the password seed.
- You must run the following helm upgrade command from the same directory where the helm install command was run during the installation of the server software. Because the upgrade is dependent on the helm charts and .yaml file values used during the run time of the helm install command.
- 2. Run the following script to generate new server secrets from the updated password seed and to save them to the persistent storage:

```
./ibm-rtas-prod/files/reconcile-secrets.sh -n test-system {my-rtas}
```

3. Run the following command to restart all the pods:

```
kubectl delete pods -n test-system \
  -lapp.kubernetes.io/instance={my-rtas} \
  -lapp.kubernetes.io/managed-by=Helm
```

4. Run the following commands to re-encrypt the user-created secrets collection or other secrets by providing the old password seed:

```
export ACCESS_TOKEN=$(curl -k -X POST ${SERVER_URL}/rest/tokens/ \
-H "Content-Type: application/x-www-form-urlencoded" \
-H "accept: application/json" \
```

```
-d "refresh_token=${OFFLINE_TOKEN}" | jq -r '.access_token')

curl -k -X POST {$SERVER_URL}/rest/secrets/re-encrypt/ \
    -H "Authorization: Bearer $ACCESS_TOKEN" \
    -H "Content-Type: application/json" \
    -d "{\"type\":\"helm\",\"password_auto_gen_seed\":\"${OLD_SEED}\"}"
```

Note: You must substitute the value of the following variables with the actual value in the following commands:

- {SERVER_URL} with the URL of your Rational® Test Automation Server UI.
- \circ {OFFLINE_TOKEN} with the offline token that belongs to a user with the administrator role.
- {OLD_SEED} with the previous password seed that you used during the installation of the server software.
- 5. Run the following command to display the log file of the gateway pod:

```
kubectl logs {my-rtas}-gateway-abcdefghij-abcde -n test-system
```

Note: You must substitute the value of the following variables with the actual value in the command:

- {my-rtas} with the release name that you used during the installation of the server software.
- · abcdefghij-abcde with an identifier that is assigned to the name of the gateway pod.

You can run the kubectl get pods -n test-system command to obtain the identifier that is assigned to the gateway pod.

Result

The following message is displayed when re-encryption is completed:

```
reEncrypt complete. StringyReEncryptor [total=100, fixed=100, broken=0, noop=0]
```

Results

You have successfully changed the password seed for Rational® Test Automation Server.

Team space administration

You can find information about team spaces including the initial team space on IBM® Rational® Test Automation Server along with the tasks that you can perform to administer a team space.

You can find the following information about team spaces:

- Team Space overview on page 78
- · Creating a team space

- Tasks in a team space on page 80
- Tasks in projects in a team space on page 84
- License management on page 85
- · Configuring email notifications

Team Space overview

You can find information about the initial Team Space that is displayed when you log in to IBM® Rational® Test Automation Server. After you install Rational® Test Automation Server, you enter a Team Space. Team Space is a logical partition of Rational® Test Automation Server to share a single installation among multiple teams.

The initial Team Space is the only logical partition created on an instance of Rational® Test Automation Server. The Team Space facilitates users of the same team space to work together.

A Team Space is an exclusive, separate, and secure space on Rational® Test Automation Server. Apart from being a container for projects, a Team Space facilitates the registration of remote Docker hosts, and viewing the registered agents, Dockers, or intercepts.

Setting up a Team Space

The initial Team Space is the only Team Space that is available, and you cannot set up any other Team Space.

When licensed users log in to Rational® Test Automation Server, they can view the **Projects** page of the initial Team Space. If the user does not have a license, then they can view the **License Configuration** page. Until a user is configured as a licensed user, the user cannot perform any operations on Rational® Test Automation Server. If you are a Server Administrator, you must first configure the licensed users so that the licensed users are enabled to perform operations on Rational® Test Automation Server.

Tasks or operations in a Team Space

If you are a server administrator, you can perform the following operations in the initial Team Space:

Tasks	More information
Configuring the licensed users	License management on page 85
Configuring an SMTP server to send email notifications	Configuring email notifications

If you are a licensed user, you can perform the following tasks:

Tasks	More information
Adding a project in the initial Team Space	Adding a project on page 364
Viewing existing projects	Viewing projects on page 367
Becoming a member of other projects	Becoming a project member on page 368

Tasks	More information
Viewing details about the licensed users or license server	Viewing license details on page 91
Viewing the SMTP configurations	Viewing email configurations
Installing remote agents and configuring them to register with Rational® Test Automation Server	Agents overview on page 139
Registering a remote Docker host with Rational® Test Automation Server	Registering a remote Docker host with IBM Rational Test Automation Server on page 153
Editing configurations of a remote Docker host	Editing configurations of a remote Docker host on page 157
Unregistering a remote Docker host	Unregistering a remote Docker host from IBM Rational Test Automation Server on page 161
Viewing remote agents, remote Dockers, or intercepts that are registered with Rational® Test Automation Server in the initial Team Space	 Viewing remote Docker hosts that are registered with IBM Rational Test Automation Server on page 155 Viewing agents that are registered with Rational Test Automation Server on page 141 Viewing intercepts that are registered with IBM Rational Test Automation Server on page 231
Creating a model of the system under test	System modeling on page 107
Adding a Team Space repository	Adding a repository to a team space on page 111
Viewing an existing system model	Viewing the system model on page 131

System Model

The system model feature enables you to model the system under test by creating components that are a logical representation of test assets or resources. You also create inter-relationships among the components. All licensed users of the initial Team Space can design a system model. You must configure a team space repository before you create the system model. See System modeling on page 107.

Note: The repository that you add to the Team Space is only used to store the system model. You cannot view this repository from the **Projects** page.

Working with projects in a Team Space

All projects are created within the initial Team Space. When you open a project, the options that are displayed in the navigation pane are specific to working with projects within a Team Space. See Working with projects on page 362.

When you are working on a project in a Team Space and you want to return to the options available for working in the Team Space, you can click the **Home** icon in the navigation pane.

Tasks in a team space

You can find information about the tasks that you can perform as a *Member, Project Owner, Architect*, or *Team Space Owner* in a team space on IBM® Rational® Test Automation Server.

The roles assigned in a team space for users are as follows:

,	Initial team space		Any team space	
Persona	Role	Notes	Role	Notes
Server ad- ministrator	Team Space Own- er	Default role assigned	Team Space Own- er	Default role assigned
Licensed user	Team Space Own- er	Role assigned by Server administrator	Team Space Own- er	Role assigned by Server administrator
	Architect	Role assigned by Team Space Owner	Architect	Role assigned by Team Space Owner
	Project Creator	Default role assigned	Project Creator	 Default role assigned in a <i>Permissive</i> team space. Role assigned by <i>Team Space Owner</i> in a <i>Restrictive</i> team space.
	Member	Default role assigned	Member	Default role assigned in either a <i>Permissive</i> or <i>Restrictive</i> team space.

The following table shows the tasks that can be performed by licensed users with their assigned roles in a team space:

Tasks	Team Space Owner	Architect	Project Creator	Member
Configuring licenses	<			
Configuring a Simple Mail Transfer Protocol (SMTP) server to send email notifications.	>			

Tasks	Team Space Owner	Architect	Project Creator	Member
Changing the license server configuration	~			
Adding members in a team space	~			
Assigning different roles to other team space members	~			
Modifying configuration details of a team space	~			
Deleting a team space	~			
Renaming a team space	~			
Adding or removing the team space repository from a team space	~	~		
Designing a system model	~	~		
Creating projects in a team space	~		~	
Adding, removing, or modifying remote Docker hosts	~	~	~	~
Adding agents	~	~	~	~
Adding, modifying, or removing resource monitoring sources	~			
Connecting resource monitoring agents	~			
Adding resource monitoring labels	~			
Working with projects in a team space	~	~	~	~

The following table provides the links to the information about the tasks that can be performed by users with different roles in a team space:

Tasks	Roles	More information
Configuring a team space license server	Team Space Owner	Configuring floating licenses on page 87
Configuring the Prioritized Floating Users	Team Space Owner	Adding users to the Prioritized Floating Users list on page 89

Tasks in projects in a team space

You can find information about the roles that you can assign in a project for members of a team space and the tasks that you can perform in projects in a team space.

Members of a team space with the role of a *Project Creator* can create projects in the team space and become the *Owner* of a project. The owners of projects can add *Members* of the team space to a project and assign them the following roles:

- Owner
- Tester
- Viewer

For the list of actions that members assigned any of the roles can perform, see Managing access to server projects on page 369.

All projects are created in a team space. When you open a project, the options that are displayed in the navigation pane are specific to the projects within a team space.

When you are working on a project in a team space and you want to return to the options available to work in the team space, you can click the **Home** icon in the navigation pane.

Note: You must be assigned the role of an Owner, a Tester, or a Viewer of a project.

The following table lists the tasks that members of a team space can perform while working with projects in a team space:

Tasks	More information
Viewing projects in a team space.	Viewing projects on page 367
Adding a project.	Adding a project on page 364
Adding a repository that contains test assets and resources that you want to run on the server.	Adding repositories to a server project on page 364
Adding secrets to a secrets collection.	Secrets configuration on page 366
Encrypting the data set resources.	Data security
Configuring a change management system.	Change management system
Adding members to a project and configuring their roles.	Adding users to a server project on page 366
Selecting the global branch in a project to view the test assets and resources.	Selecting the global branch in a project on page 376
Adding agents to your project, if you are using remote agents as a location to run certain tests.	Adding an agent to a project on page 142

Tasks	More information
Adding remote Dockers, if you are using a remote Docker host as a location to run tests.	Adding a remote Docker host to the project for running tests on page 156

License management

You as a server administrator can configure and manage licenses. As a licensed user you can only view the details of the licenses configured. If you are not a licensed user you cannot view or perform any operations on Rational® Test Automation Server.

When you log in to Rational® Test Automation Server after you install the server software, you can encounter the following conditions:

- The No licenses configured dialog box is displayed.
- The No licenses configured dialog box is displayed if you click Manage > Licenses.
- The New Project button is disabled.

Depending on your privileges you can perform the following tasks in Rational® Test Automation Server:

Privileges	Tasks	More information
Server administrator	Read about licensing on Rational® Test Automation	Licensing overview on page 86
	Server.	

Privileges	Tasks	More information
	Configure licenses.	Configuring floating licenses on
	Configure prioritized users.	page 87
	Remove or replace prioritized users.	Removing or replacing floating users on page 89
Licensed user	Perform tasks or operations in a Team Space.	Tasks or operations in a Team Space on page 78
	Viewing details about licenses.	Viewing license details on page 91

Licensing overview

You can find information about the licensing on Rational® Test Automation Server.

To use the features offered by Rational® Test Automation Server, you must purchase the licenses for the number of licensed users that you want to configure. You must then install the licenses on Rational License Key Server and configure the license server details on Rational® Test Automation Server.

The addition of the **Prioritized Floating Users** option in the **License Configuration** page enables the administrator to add users to the prioritized users list. The prioritized floating users do not return their floating licenses to the license pool when they log out from Rational® Test Automation Server. Rational License Key Server ensures that the licenses are always available for the prioritized users. This feature is useful for those users who generate offline tokens that are used for long-run tests even when the members are logged out of Rational® Test Automation Server.

A single floating license is used when the user performs any of the following tasks for the first time on Rational® Test Automation Server:

- Create a project as your first action after you log in.
- Log in subsequently and open a project that you created as your first action.
- Open a project of which you are already a member as your first action after you log in.
- Run tests on any of the third-party applications that are integrated with Rational® Test Automation Server.

The floating license that was assigned to you is returned to the license pool when you perform any of the following actions:

• Log out from Rational® Test Automation Server.

Remember: The floating licenses assigned to prioritized floating users are not returned to the license pool when they log out from Rational® Test Automation Server.

- End a session on Rational® Test Automation Server or session is timed out.
- Complete the test runs on any of the third-party applications that are integrated with Rational® Test Automation Server.

Important:

Processor Value Unit (PVU) licenses are not supported for running Rational® Performance Tester schedules in Rational® Test Automation Server. You must configure floating licenses to run Rational® Performance Tester schedules in Rational® Test Automation Server.

Related information

Configuring floating licenses on page 87

Configuring floating licenses

As an administrator, you must configure the number of floating licenses that you have purchased in Rational® Test Automation Server so that licensed users can perform various operations such as creating a project, running tests, and so on.

Before you begin

You must have completed the following tasks:

- Purchased the licenses to use Rational® Test Automation Server.
- Installed the product and signed up as a user on Rational® Test Automation Server.
- Been assigned the role as an administrator of Rational® Test Automation Server.

About this task

As an administrator, you can assign the role of an administrator to any user. For information about how to change the role, see Default user administration at the Related information section.

Note: When your role is changed from a user to an administrator, you must log out and log in again so that Rational® Test Automation Server can apply the change in your role.

1. Log in to Rational® Test Automation Server.

The License Configuration page is displayed for the first time you log in if the licenses are not configured.

Alternatively, you can click Manage > Licenses.

2. Enter the number of floating user licenses in the No. of floating users (Max) field.

Alternatively, you can use the up-down control buttons to change the number of licenses in the field.

Remember: You must ensure that the number of floating licenses that you configure does not exceed the number of licenses you have purchased.

Important: You can allocate the purchased licenses across multiple servers only if the total number of floating users that you configure across the servers does not exceed the total number of purchased licenses.

3. Enter the IP address of the license server in the **Rational License Key Server** field to install the licenses on the license server.

You must enter the IP address in the following format:

port_number@IP_address

Note: If you did not provide any port number, the default port number is used for the license server.

4. Click **Configure** to verify that you have entered the permissible number of licenses that you want to use on this server.

The Licensing compliance dialog box is displayed.

- 5. Click **Confirm** to apply the license configuration.
- 6. Enter the name or the email ID of the users in the **Add prioritized floating users** field, and then select the name from the list that is displayed to add users to the **Prioritized Floating Users** list.

Note: You can press the Ctrl key to select multiple users simultaneously.

7. Click **Add** to make selected users as the prioritized floating users.

Results

You have configured the license server. You can view the number of prioritized floating user licenses configured in the **License usage** section.

Related information

Default user administration on page 58

Removing or replacing floating users on page 89

Adding users to the Prioritized Floating Users list

As an administrator, you can add users to the **Prioritized Floating Users** list so that the licenses are always available for those users.

Before you begin

You must have completed the following tasks:

- Been assigned the role as an administrator of Rational® Test Automation Server.
- 1. Log in to Rational® Test Automation Server and open the team space for which you want to add users.
- 2. Enter the name or the email ID of the user in the **Add prioritized floating users** field, and then select the name from the list that displays to add members to the **Prioritized Floating Users** list.

Note: You can press the Ctrl key to select multiple users simultaneously.

3. Click Add to make selected users as Prioritized floating users.

Results

You have added users to the **Prioritized Floating Users** list. The **License usage** section displays the following information:

- The number of floating user licenses that are currently in use
- The number of prioritized floating user licenses that are currently in use

Removing or replacing floating users

When you want to remove a user from the list of prioritized users or you want to replace an existing user with another prioritized user, you as an administrator can perform these changes from the **License Configuration** page.

Before you begin

You must have completed the following tasks:

- Been assigned the role as an administrator of Rational® Test Automation Server.
- Configured licenses and added users to the list of prioritized users on Rational® Test Automation Server.

1. Log in to Rational® Test Automation Server.

Result

The Projects page of the initial Team Space is displayed.

2. Click Manage > Licenses.

Result

The **License Configuration** page is displayed with licensing details.

3. Perform the actions described in the following table to remove or replace users from the **Prioritized Floating**Users list:

Task	Actions
Remove a user from the list of prioritized users	Perform the following steps: a. Locate the user from the Prioritized Floating Users list that you want to remove.
	 b. Click the Menu icon next to the name of the user, and then click Remove. c. Click Remove on the Remove prioritized user dialog box to complete the action.
	Remember: When you remove the user from the Prioritized Floating Users list, the test runs scheduled by the user fail to run if sufficient floating licenses are unavailable. If the user is currently on Rational® Test Automation Server, then the license can be used while the current session remains active.
Replace a user in the list of priori- tized users	Perform the following steps: a. Locate the user from the Prioritized Floating Users list that you want to replace with another user.
	 b. Click the Menu icon next to the name of the user, and then click Replace. c. Enter the email ID or name of another user that you want to add to the Prioritized Floating Users list.
	d. Click Replace to complete the action.

Results

You have removed or replaced a user from the prioritized users list.

Viewing license details

You can find information about the number of licenses configured, licensed users, or details of the license server on the **License Configuration** page.

Before you begin

The server administrator must have configured the licenses on Rational® Test Automation Server.

About this task

You as a licensed user can create projects or use the other features in Rational® Test Automation Server only after the server administrator has configured the licenses. If you are not a licensed user, you cannot view or perform any operations on Rational® Test Automation Server.

1. Log in to Rational® Test Automation Server.

Result

The Projects page of the initial Team Space is displayed.

2. Click Manage > Licenses.

Result

The **License Configuration** page is displayed with the following license information:

- The number of prioritized floating user licenses that are currently in use
- $\,{}^{\circ}$ The total number of floating licenses that are configured by the administrator
- $_{\circ}$ The value of Rational License Key Server
- The name and email ID of the users that are configured as prioritized floating users by the administrator

Chapter 5. Test Author Guide

This guide describes how to create test assets in Rational® Test Automation Server and publish test assets to the Git repository that you have configured. This guide is intended for testers and test managers.

Datasets overview

A dataset provides tests with variable data during a run. The test that uses a dataset at run time replaces a value in the recorded test with variable test data that is stored in the dataset.

In Rational® Test Automation Server, you can create a dataset and use it to replace the dataset values with original values during run time, when you want to run test assets that contain the dataset.

From the **Datasets** page, you can perform the following actions:

Table 3. Options available in Datasets page

	bie 3. Options available in Datasets page			
Ac- tions	Descriptions			
View	You can view the contents of a dataset. See Viewing a dataset on page 103.			
Cre- ate	You can create a dataset to use it during a test or schedule run. See Creating a dataset on page 93.			
Edit	You can edit a dataset when you want to run a test asset with different dataset values. See Editing a dataset on page 94.			
Con- figure	You can configure the string values in a dataset that contains variable data for tests to use when they run. See Editing a dataset on page 94.			
Delete	You can delete the dataset when it is not required in your test environment. See Deleting a dataset on page 105.			
Save As	You can save a copy of a dataset in a different folder or make a copy with a different name by clicking the Menu icon and then by selecting the Save As option.			
Branch selec- tion	You can view the dataset listed in the other branches of the repository by selecting the name of the branch from the Branch list. When you access the Datasets page for the first time after adding the repository, the default branch that it displayed is master .			
	When multiple repositories are added to the same project, the following events occur:			
	The datasets stored in the master branch of all the repositories are displayed.			
	All the branches in all the repositories are listed in the drop-down list.			

Table 3. Options available in Datasets page (continued)

Ac- tions	Descriptions
	To differentiate a common branch across multiple repositories added to the project, the tooltip is not displayed in front of the common branch name in the list.

Notes:

- Only a project **Owner** or a project member whose role is a **Tester** can view and edit the dataset.
- To view the content of an encrypted dataset, you must provide an encryption key that you set while encrypting the dataset column.
- As a Viewer, when you try to access the Datasets page, an error message is displayed because you do
 not have the permission to view this page.

Creating a dataset

You can create datasets in Rational® Test Automation Server to replace the existing dataset values with new dataset values during a test or schedule run.

Before you begin

You must be a member of the project with the Owner or Tester role and must have completed the following tasks:

- Created a project in Rational® Test Automation Server. See Adding a project on page 364.
- Configured the Git repository in your project. See Adding repositories to a server project on page 364.

About this task

When you create a dataset in Rational® Test Automation Server, it always creates 1 Row, 2 Column (1R X 2C) dataset. Later, you can edit the dataset by adding some rows and columns that you want, to add the data in it.

- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the Rational® Test Automation Server UI.
- 4. Go to the Datasets page, and then click Create dataset.
- 5. Enter a name for the dataset in the **Asset name** field, and then select the place where you want to save the dataset in the **Location** drop-down list.
- 6. Click Create.

Result

The new dataset opens in a CSV Editor in a web browser. The dataset created is listed on the **Datasets** page.

Results

You have created a dataset in your project.

What to do next

- You can add, modify, or remove data in the dataset. See Editing a dataset on page 94.
- You can publish the dataset to the Git repository so that other members of the project can use the dataset. See Publishing a dataset on page 102.

Editing a dataset

You can add, modify, remove, import, or export data from a dataset by using the CSV Editor. The working principle of the CSV Editor is similar to that of a spreadsheet.

Before you begin

You must have created a dataset or configured a repository that contains the dataset.

About this task

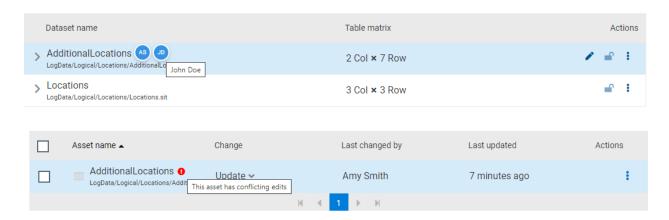

If you are a project **Owner** or **Tester** in Rational® Test Automation Server V10.1.0 or later, you can perform basic tasks in the CSV Editor by right-clicking any row, column, or cell in the dataset to organize your data in a better way. For example, you can perform tasks such as updating data in a cell, inserting or deleting rows and columns, or renaming column names.

When you edit the dataset in the CSV Editor, you can use the following keyboard shortcuts to control the cursor selection in the CSV Editor:

- **Tab** To move the cursor control to the next available option.
- Shift-Tab To move the cursor control to the previous option.
- Shift+F10 To open the context menu from the dataset cell.

After you edit the dataset, you can save the changes made to the dataset, and then you can publish the dataset to the Git repository. If you save and close the edited dataset, the **Changes** page lists the edited dataset and later you can publish to the Git repository for other members to use.

When you or other members of the project edit the same dataset, you can see an icon with the initials of the member next to the name of the dataset on the **Datasets** and **Changes** pages. If you do not see the icon, you must refresh the **Datasets** page to view the icons. The **Changes** page denotes conflicting edits when another member publishes their edited dataset first.

When a member with conflicting edits tries to publish the edited dataset, an error about conflicting changes is displayed. However, the member can use the **Save As** option to save and publish a copy of the dataset edits under a new asset name. The member must discard the edits that were made to the original dataset.

For example, consider a scenario when Amy Smith and John Doe edit the same dataset, and Amy Smith edits and publishes the dataset. On the **Changes** page, a message that indicates a conflict is displayed when John Doe tries to publish the same dataset.

Note: You cannot resize the width of rows in the CSV Editor. When you have a large amount of data in a cell, you can right-click the cell and select **Copy** (or Ctrl+C), and then paste it into a text-editing program to view the content. Alternatively, you can hover the mouse over the cell to view the content.

When you have a CSV file that has data separated from a character, then you can import that CSV file into the dataset. You can select any of the following separator characters from the **Configure Dataset** window, and the selection can be the separator character that you used in the CSV file:

- Comma
- Semicolon
- Space
- Tab
- Other

Consider that you have the data in the CSV file in the following format:

Name;CCNum
John;1234 5678 1234 5678
Bob;1122 3344 5566 7788
Amy;2233 4455 6677 8899

When you import the CSV file in the dataset, and then select the separator value as **Semicolon**, the data in the dataset is displayed as follows:

	Name	CCNum	
1	John	1234 5678 1234 5678	
2	Bob	1122 3344 5566 7788	
3	Amy	2233 4455 6677 8899	

If you want the data in its original format, that is, a semicolon (;) character to separate the data, then you can choose any other separator value from the **Configure Dataset** window.

Note: The default separator value is **Comma**.

- 1. Go to the **Datasets** page and find the dataset which you want to edit.
- 2. Click the **Edit** icon of from the **Actions** column of the dataset.

Result

The dataset opens in the CSV Editor in a web browser.

3. Perform the following actions to use the options available in the CSV Editor:

Options	Actions	
Find	To find:	
and Re-	 a. Click the Find and Replace icon b. Enter the content that you want to search in the Find field. c. Select any or all the following options to find the search content more effectively: Select the Case sensitive checkbox to search the content that is the exact letter case of the content entered in the Find field. 	
	 Select the Match entire cell contents checkbox to search for cells that contain only the characters that you have entered in the Find field. Select the Search using regular expression checkbox to search the pattern that matches strings. 	
	For example, to search a cell that contains any number between 0 to 9, do the following: i. Enter \d in the Find filed. ii. Select the Search using regular expression checkbox. iii. Click Find. d. Click Find. If the text is found, the cell containing that text is selected. e. Click Find again to find further instances of the search text.	
	To find and replace:	

Options	Actions			
	Q			
	a. Click the Find and Replace icon			
	b. Enter the content that you want to search in the Find field.			
	c. Enter the content that you want to replace in the Replace field.			
	d. Select any or all the following options to find and replace the content more effectively:			
	Select the Case sensitive checkbox to find the content that is the exact letter			
	case of the content entered in the Find field.			
	Select the Match entire cell contents checkbox to find and replace for cells that			
	contain only the characters that you have entered in the Find and Replace field			
	Select the Search using regular expression checkbox to find and replace the pat-			
	tern that matches strings.			
	e. Click Replace to replace the individual instances.			
	f. Click Replace All to replace every instance of the content throughout the dataset.			
CobnU	a. Click the Undo icon 5 .			
Ondo	b. Select the recent changes from the list that you want to undo, and then click the list.			
	The Undo option undoes anything you do in the dataset. The CSV Editor saves the unlimited un-			
	do-able action. You can perform the undo action even after you save your changes made to the			
	dataset.			
Redo C	a. Click the Redo icon ^C .			
	b. Select the recent changes from the list that you want to redo, and then click the list.			
	The CSV Editor saves the unlimited redo action.			
Import	When you have a large amount of data stored in a CSV file, you can import that into a dataset in-			
import	stead of creating a new dataset. You must have a .csv file that contains variable data to import			
-23	into a dataset.			
	into a dataset.			
	a. Click the Import icon [•] .			
	b. Click Choose File and select the CSV file that you want to import in the Import File dia-			
	log box.			
	c. Select one of the following options to append or overwrite data in the dataset:			
	 Click Overwrite to add the rows and columns from the selected CSV file from the 			
	beginning of the dataset.			
	Click Append to add rows and columns from the selected CSV file to the end of			
	the dataset.			
	d. Select the First row contains headers checkbox if your CSV file contains the header.			
Export	You can export variable data from the dataset into a CSV file to reuse in future tests when re-			
1	quired. You must have a dataset that you want to export.			

Options	Actions
	Click the Export icon to download the dataset as a CSV file.
Set as cur- rent row	During the test run, if you want variable data to be selected from a current row instead of the first row in a dataset, right-click any cell in a row and select Set as current row .
	Also, you can set the current row from the Datasets page by clicking Menu , and then the Configure option.
	When rows are deleted:
	If you delete any row between row 1 to current row, the current row data is taken from the next row. For example, when you set the current row as 6, and then you delete any row between row 1 to row 6, the current row remains at row 6, but the content of row 7 is moved to row 6.
	When rows are inserted:
	If you insert any new row between row 1 to the current row, the current row data is taken from the previous row. For example, when you set the current row as 6, and then you insert any row between row 1 to row 6, the current row remains at row 6, but the content of row 5 is moved to row 6.
Dataset configu-	In the Configure Dataset window, you can change the row and column settings and configure the string values in the dataset that contains variable data for tests to use when they run.
ration set-	a. Click the Menu icon , and then select the Configure option.
tings	b. Select any of the separator values that you used in the CSV file.
	The available options are Comma, Semicolon, Space, Tab , and Other . In the CSV file, if you have any other separator characters other than the available options, then you can select the Other option, and then can specify a value.
	For example, if the data in the CSV file is separated by a character #, then select the Other option and enter # in the field.
	c. Configure the following options to change the row and column settings:
	Column header - Use an up-down control button to increment or decrement the value of the column header.
	Data start point - Use an up-down control button to increment or decrement the value of the data starting pointer.
	Current row - Use an up-down control button to increment or decrement the value of the current row.

Options	Actions		
	d. Configure the following options to change the string values in the dataset:		
	Treat as null - Enter a string value that is to be treated as null when running the test.		
	Treat as empty - Enter a string value that is to be treated as empty when running the test.		
	For example, when you run the test and the data 123 in the dataset to be treated as empty, then you can specify 123 in the Treat as empty field.		
	Treat empty text as null - Select this field when you want the dataset that contains any blank cells, and the value of those blank cells to be interpreted as null.		
	e. Click Update to apply the changes.		
Discard	Click the Menu icon and select Discard to discard the changes made to the dataset.		

- 4. Click the **Save** icon to save the changes made to the dataset.
- 5. Click the **Publish** icon to publish the dataset to the Git repository, and then close the CSV editor.

Results

You have edited the dataset.

Dataset encryption

Encrypted datasets are useful when you want to run tests that contain confidential information such as a set of passwords or account numbers.

When you run a test that uses an encrypted dataset, then you must provide an encryption key for decrypting the encrypted data in columns so that the data can be used in the test. If the test uses data from the multiple encrypted dataset columns, you must enter the same encryption key for every encrypted dataset column that the test uses.

When you run the test that uses the dataset with the encrypted column, the value of the column is decrypted at a run time. The data in the column is sent as a clear-text string in requests to the server. The actual values of the encrypted dataset variables are not displayed in the test log. The test log displays asterisks for the encrypted dataset variables.

You can use only one encryption key to encrypt data in the columns in any dataset.

The encryption keys that you use to encrypt data in a dataset are not stored on the server nor can be retrieved from the server. Therefore, you must remember to store the encryption keys in a secure location. You must use the same encryption keys to perform the following operations:

- View the encrypted values
- · Decrypt data
- · Enable the use of the encrypted dataset during test runs

Encrypting a dataset column

To secure test data, you must encrypt datasets. You can encrypt data in the columns of a dataset by using an encryption key. When you run a test that utilizes a dataset with encrypted variables, you must enter the encryption key for the encrypted column that the test uses.

Before you begin

You must have created a dataset. See Creating a dataset on page 93.

- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the Rational® Test Automation Server UI.
- 4. Go to the Datasets page and find the dataset that you want to encrypt.
- 5. Click the **Edit** icon from the **Actions** column of the dataset.

Result

The dataset opens in the CSV Editor in a web browser.

6. Right-click any cell in a column that you want to encrypt and select Encrypt column data.

Result

The **Encrypt Column** window is displayed.

7. Enter an encryption key in the **Encryption Key** field to encrypt the data in the column.

Remember: When you have already encrypted other columns in the dataset, you must enter the same encryption key that you used previously. You can use only one encryption key to encrypt columns in a dataset.

Important:

The encryption keys that you use to encrypt data in a dataset are not stored on the server nor can be retrieved from the server. Therefore, you must remember to store the encryption keys in a secure location. You must use the same encryption keys to perform the following operations:

- View the encrypted values
- Decrypt data
- Enable the use of the encrypted dataset during test runs
- 8. Click Encrypt Column.

Result

Asterisks are displayed instead of actual data for the encrypted column.

Results

You have encrypted the dataset column in your project.

What to do next

You can publish the dataset to the Git repository so that other members of the project can use the dataset. See Publishing a dataset on page 102.

Decrypting a dataset column

To view the content of an encrypted dataset, you can decrypt the dataset column. Removing encryption from a dataset revokes the protection offered to the test data.

Before you begin

You must have created at least one dataset and encrypted the dataset with an encryption key. See Creating a dataset on page 93 and Encrypting a dataset column on page 100.

- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the Rational® Test Automation Server UI.
- 4. Go to the **Datasets** page and find the dataset that you want to decrypt.
- 5. Click the **Edit** icon from the **Actions** column of the dataset.

Result

The dataset opens in the CSV Editor in a web browser.

Right-click encrypted cells that display the contents with asterisks, and then select Decrypt column data.

Result

The **Decrypt Column** window is displayed.

- 7. Enter the encryption key that you used to encrypt the data in the column in the **Encryption Key** field.
- 8. Click Decrypt Column.

Result

Asterisks are replaced with the actual data in the decrypted column.

Results

The encryption is removed from the selected column in the dataset. When you run a test that uses a dataset that contains decrypted data, the variable data is substituted for the original data in the recorded test without prompting for the encryption key.

What to do next

You can publish the dataset to the Git repository so that other members of the project can use the dataset. See Publishing a dataset on page 102.

Publishing a dataset

When you create or edit any datasets in Rational® Test Automation Server, you can publish your changes to the Git repository. Therefore, when you publish a dataset, other members in the project can use your dataset in their test assets run, if required.

Before you begin

You must have created, edited, or deleted dataset assets in Rational® Test Automation Server.

About this task

The **Changes** page lists dataset assets that are modified. You can publish all datasets or a single dataset listed in the **Changes** page to the Git repository by selecting the appropriate checkboxes.

Rational® Test Automation Server processes one publish request at a time. Therefore, when multiple users attempt to publish the same dataset, the request that reaches first from the users is processed. The other users receive an error message, and they are unable to publish.

When you modify the dataset and publish it to the Git repository, the other members who have access to that dataset can view the updated dataset.

You can also perform the following actions from the Changes page by clicking the **Menu** icon

- Edit If you want to make any last-minute updates to the dataset before publishing.
- Discard To remove the changes that you made to the dataset asset.
- Save As To save a copy of dataset.
- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the Rational® Test Automation Server UI.

- 4. Go to the Changes page, find the dataset that you want to publish.
- 5. Select the checkbox that precedes the Dataset name to publish to the Git repository, and then click Publish.
- 6. Enter a description for the changes made to the dataset, and then click **Publish**.

Result

A message is displayed for successful pushing of changes to the Git repository.

Results

You have published the modified dataset into the Git repository.

Viewing a dataset

When test assets includes datasets, you can view the contents of a dataset from Rational® Test Automation Server. The datasets residing in the Git repository are listed in the **Datasets** page.

Before you begin

You must be a member of the project with the **Owner** or **Tester** role and must have completed the following tasks:

- Created a project in Rational® Test Automation Server. See Adding a project on page 364.
- Configured the Git repository in your project. See Adding repositories to a server project on page 364.
- Created at least one dataset and encrypted the dataset with an encryption key. See Creating a dataset on page 93 and Encrypting a dataset column on page 100.
- Created a classification for an encrypted dataset. See Creating a classification on page 384.
- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the Rational® Test Automation Server UI.
- 4. Go to the **Datasets** page, find the dataset that you are interested in, and then expand the dataset by clicking the **Expand** icon \geq .

Note: You can click the **Dataset Name** field to sort the datasets by name in alphabetical order. Alternatively, you can use the **Search** field to search the dataset by name.

Results

You have viewed the contents of the dataset.

Viewing an encrypted dataset

You can use the **Dataset** page to view the contents of an encrypted dataset from Rational® Test Automation Server.

- 1. Go to the **Datasets** page, find the encrypted dataset that you are interested in, and then expand the dataset by clicking the **Expand** icon \geq .
- 2. Perform the following steps, if you have created a classification but yet to add the encrypted dataset to it:
 - a. Find the encrypted dataset that you are interested in, and then click the **Lock** icon from the **Actions** column of the dataset.
 - b. In the **Change the classification for the dataset** window, select a classification from the list and enter the encryption key set for the dataset.
 - c. Click Save to save the classification details.
- Right-click the encrypted column and click Show encrypted data.
 You can right-click the decrypted column and select Hide encrypted data to encrypt the data again.

Important: The **Show encrypted data** option is available only when you have added the encrypted dataset to the respective classification.

Results

You have viewed the contents of an encrypted dataset.

Changing classification for an encrypted dataset

To move the encrypted dataset from one classification to another, you can change the classification for an encrypted dataset from the **Dataset** page.

Before you begin

You must have created at least two or more classifications. See Creating a classification on page 384.

- 1. Go to the **Datasets** page and find an encrypted dataset for which you want to change the classification.
- Click the Lock icon from the Actions column of a dataset.
- 3. In the Change the classification for the Dataset window:
 - a. Choose the classification from the list.
 - b. Enter the encryption key for the dataset that was set while encrypting the dataset column.
 - c. Save the classification details.

Remember: You can perform this task only if you know the encryption key set for the dataset while encrypting the dataset column.

Results

You have changed the classification for an encrypted dataset.

Related information

Managing an encrypted dataset on page 383

Creating a classification on page 384

Deleting a dataset

You can delete the dataset when it is not required in your test environment.

Before you begin

You must have at least one dataset asset in your Git repository that you have configured.

About this task

You can delete datasets in Rational® Test Automation Server in the following scenarios:

- Datasets that you created in the desktop clients and that are cloned to the repository in your project on Rational® Test Automation Server.
- Datasets that you created in Rational® Test Automation Server and that are published to the repository in your project.
- Datasets that are in the .csv file format.

You cannot delete the following datasets:

- Datasets that you created or edited in Rational® Test Automation Server and that are not published to the repository in your project.
- Datasets that are in the .sit file format.
- 1. Go to the Rational® Test Automation Server URL.
- 2. Enter your user name and password, and then click **Login**.
- 3. Open your project from the Rational® Test Automation Server UI.
- 4. Go to the **Datasets** page, find the dataset that you want to delete.
- 5. Click the Menu icon from the Actions column of a dataset, and then click Delete.
- 6. Clear the **Publish delete to** <**br/>branch name of the configured Git repository>** checkbox to delete the dataset from your project.

When you clear this option, the deletion of the dataset does not reflect in the configured Git repository. Therefore, the other members of the project can still use the dataset that you have deleted. If you want, later you can publish the dataset to the Git repository from the **Changes** page.

Note: By default, Publish delete to

branch name of the configured Git repository> field is selected.

- 7. Enter a description for deleting the dataset in the **Description of change** field.
- 8. Perform the following action:

Option	When	Action
Publish delete to branch name of the config-	Selected ☑	Click Delete and Publish
ured Git repository>	Cleared □	Click Delete

Result

A message is displayed for the successful deletion of the dataset.

Chapter 6. Test Execution Specialist Guide

This guide describes tasks that you must complete before you can configure and run tests in Rational® Test Automation Server. You can find information about configuring runs for the different test types that are supported. You can also find information about other tasks that you can perform on the Resource Monitoring Service, Virtualization, and Integrations with third-party applications. This guide is intended for testers or test execution specialists.

System modeling

In this topic, you can find information about using the system model feature. You can also find the tasks that you can perform to create a system model. You must configure a repository to save the system model that you created for the application under test.

Introduction to system model

A system model is a logical presentation of the components contained in a system under test and the relationships between components. You can create a system model when you want to visualize the different components and their relationships as a diagrammatic representation.

You can create only one system model within a team space on Rational® Test Automation Server. A team space repository is required to contain the system model that you create. Before you can create a system model, you must add a team space repository. The system model that is created or edited is stored in the team space repository. All projects within a team space share the same system model. All members of a team space can create, edit, and view the system model.

After you log in to Rational® Test Automation Server, you can go to the **System Model** page to create a system model for your team space. Alternatively, you can go to any of the projects in your team space and create a system model from the **System Model** page within a project. The system model is accessible from all the projects of your team space repository.

Components in a system model

Components are the basic building blocks which are used to represent a piece of software in an application.

You can model a system by using components. You can create components that represent the type of asset or resource used by the system or application under test and can be of the following types:

Component type	Description
Database	The component type represents the database resource. You can select this component type when you want to represent a database asset or resource in the system model.
Service	The component type represents the virtual service resource. You can select this component type in the system model to represent a virtual service in the team space repository or associate a virtual service resource that is in the project repository.

Component type	Description
UI	The component type represents the User Interface (UI) resource. You can select this component
	type when you want to represent the User Interface resource in the system model.

You can create multiple components to depict the different resources in the system or application under test. You can also associate virtual service resources with the components. The components in the system model can then be associated with the virtual services stored in the repositories that are configured for each of the projects.

You can create the following types of relationships between the components:

- Components can be related as child components to parent components.
- Components can be related as *dependent* components. The dependency is displayed by a line-arrow with the arrow-head pointing to the dependent component. For example, if *Component A* depends on *Component B*, then the relationship is displayed with a line-arrow from *Component A* to *Component B* and the arrow points to *Component B*. If Component B is also dependent on *Component A*, then the relationship is displayed with a line-arrow from *Component B* to *Component A* and the arrow points to *Component A*.

Using the system model UI

The following table lists the icons used in a system model and the icons that are displayed on the **System Model** page:

Icon	Description
٨	Represents a system model.
500	Represents Suites and Tests in a repository.
	Represents a database resource. The component name is prefixed with this icon when you select the component type as database.
©	Represents a service resource. The component name is prefixed with this icon when you select the component type as service.
<u>P</u>	Represents a User Interface (UI) resource. The component name is prefixed with this icon when you select the component type as User Interface.
(+)	Used to add components, child components, and dependent components.
Q	Used to search for components in the system model.
ಹಿ	Represents the virtual services.
(4)	Used to publish the system model to the team space repository.
	Represents the dependency between the components.

Icon	Description
	Represents the inherited dependencies.

You can perform the following operations when you view the model displayed on the **System Model** page:

Operation	Action
Pan the view of the model	 Click the Pan icon Click on the area of the model that you want to pan and move the area keeping the mouse pressed. Note: You must click the Pan icon to exit from the pan mode.
Zoom-in the view of the model	 Click the Zoom-in icon ♠. The view is enlarged or zoomed-in. Note: You can repeatedly click the Zoom-in icon to further enlarge the view.
Zoom-out the view of the model	1. Click the Zoom-out icon . The view is diminished or zoomed-out. Note: You can repeatedly click the Zoom-out icon to further diminish the view.
Reset the view	 Click the Menu icon on the System Model page. Select Reset Zoom. The view is reset to the default view without any zoom applied. If the view was zoomed-in or zoomed-out, the view is reset to 100% of the size.

2. Select from the following options: • Center: Select this option to align the	Operation	Action
page. • Fit to View : Select this option to fit the	Position the model view	 Center: Select this option to align the view of the model to the center of the page. Fit to View: Select this option to fit the view of the model in the window on the

Tasks in system modeling

When you want to model the system under test for the first time after you install the server software and you are a licensed user in the team space, you must first add the team space repository. See Adding a repository to a team space on page 111.

After a repository is configured as the team space repository, you can work with the system model. See Tasks for working with a system model on page 110.

When you want to change, update or delete the repository, you can work with the team space repository. See Tasks for working with the team space repository on page 111.

Task flows for working with a system model

You can find information about the tasks that you can perform when you want to create a system model, create components, associate the components, create linkages among the components, and then publish the system model to the team space repository. Also, you can find information about the tasks that you must perform when you want to modify an existing system model.

Tasks for working with the team space repository

You can find the tasks that you can perform when you want to work with the team space repository.

Tasks	More information
Add a repository to the team space.	Adding a repository to a team space on page 111
Delete a team space repository.	Deleting a repository that is added to a team space on page 132

Adding a repository to a team space

You must add a repository to the team space when you want to create, modify, or store a system model.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as a Team Space Owner or an Architect in the team space. See Managing members and their roles in a team space on page 358.
- Been provided valid credentials to access the Git repository that you want to add.

About this task

As a *Team Space Owner* or an *Architect*, you can add a repository to the team space. You can add a repository to the team space in any of the following methods:

- · Add an existing repository that can contain test assets, which are created in the desktop products.
- · Add a bare repository.

Attention: The repository that you want to add must not contain any projects or .project files under the root directory.

When you add a repository, the Git repository is cloned to the team space. While adding a repository, you must provide the necessary authentication credentials that are set for the Git repository. For example, if the authentication type is SSH, then you must provide the Git URL, a deploy key, and a passphrase.

- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which you want a team space repository.

The Active projects page is displayed.

3. Click the **Settings** icon from the left navigation pane, and then select **Manage team space**.

The **Details** page is displayed.

4. Click Repository on the left navigation pane.

The **Repository** page is displayed.

5. Click Add repository.

The **Add repository** dialog is displayed.

6. Enter the URL of the Git repository, which you want to add to the team space, in the Git Repository field.

The required fields are displayed based on the type of Git URL that you entered.

7. Enter the required credentials based on any of the following authentication methods configured in the repository.

To gain access to the repository, you must use any one of the authentication methods:

Authentication method	Credentials required
SSH	∘ Deploy key ∘ Passphrase
HTTPS	∘ User name ∘ Password
НТТР	∘ User name ∘ Password

Notes:

- You must have defined the authentication type and set the authentication credentials in the Git repository.
- If you use SSH to connect to your remote repository and Rational® Test Automation Server displays an Auth Fail exception while using the deliver changes option, you can resolve this exception error by regenerating your SSH keys by using the -m PEM option.

8. Click Add.

The Git repository is added to the team space on Rational® Test Automation Server.

Note: Depending on the size of the repository you are cloning, it can take a few to several minutes to clone the repository.

What to do next

You can perform the following actions on the repository that you added:

- Add a system model to the repository. See Creating a system model on page 113.
- Delete a repository that is added to the team space, if it is no longer required.

Related information

Managing repositories on page 373

Creating a system model

Before you can create components in a system model, you must create an empty system model and publish the system model to the team space repository.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as an Architect in the team space, a Project Owner or a Tester in the
 project. See Managing members and their roles in a team space on page 358 or Managing access to server
 projects on page 369.
- Added a repository to the team space. See Adding a repository to a team space on page 111.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

- 3. Select an option to create a system model based on your role in the team space or in a project in the team space:
 - If you are a Team space owner or an Architect, go to Step 4 on page 114.
 - If you are not a *Team space owner* or an *Architect* but a project *Owner* or *Tester*, go to Step 5 on page 114.
- 4. Perform the following steps, if you are a Team space owner or an Architect:
 - a. Click System Model on the left navigation pane.

The **System Model** page is displayed.

b. Click the Add system model icon 🕀.

An empty system model is created.

- c. Go to Step 6 on page 114.
- 5. Perform the following steps, if you are not a Team space owner or an Architect but a Project owner:
 - a. Open your project that is displayed under My projects on the Active projects page.

The **Overview** page is displayed.

b. Click **System Model** on the left navigation pane.

The **System Model** page is displayed.

c. Click the Add system model icon 🕀.

An empty system model is created.

- d. Go to Step 6 on page 114.
- 6. Click the See unpublished commits icon 4, and then select the Publish changes option.

Note: If you do not want to commit the changes that you made to the system model, you can select the **Discard changes** option.

7. Enter a commit message in the **Description of change** field, and then click **Publish**.

The empty system model is committed and published to the team space repository. When the system model is published to the team space repository, other members of the team space can work with the same system model from any of their projects in the team space.

Results

You have created an empty system model and published it to the team space repository.

What to do next

You can perform any of the following tasks:

- Create components in the system model. See Creating components on page 115.
- Create child components for the components that you added to the system model. See Creating child components on page 116.

Creating components

The first step in building a system model is to create components. The components serve as the building blocks for the system model.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click **System Model** on the left navigation pane.

The System Model page is displayed.

- 4. Perform the following steps to add a component to the system model:
 - a. Click the **Add component** icon + in the **Components** row on the right pane.

The Add a component dialog is displayed.

b. Enter a name for the component in the **Name** field.

- c. Select the type of component that you want to add from the following options displayed in the **Type** field.
 - 🔯 Service
 - Database
 - > U

d. Click Add.

The component is displayed as a circular block on the system model pane with the icon and name of the component below the block. The added component is also displayed under the **Components** list in the right pane.

You create components of other types or the same type in the system model following the preceding steps.

Results

You have created components in the system model.

What to do next

You can perform any of the following tasks:

- Publish the changes that you made to the system model. See Publishing changes to the system model on page 124.
- Create child components for the components that you added to the system model. See Creating child components on page 116.
- Create linkages between components in the system model. See Creating linkages between components on page 118.

Creating child components

You can create components as children of existing components in the system model.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.

About this task

You can create multiple components in your system model and multiple child components under any component in the system model. After you create a child for a component, the child is represented as a circular block within the circular component block in the system model.

- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click System Model on the left navigation pane.

The **System Model** page is displayed with the existing components.

- 4. Create child components in any of the following methods:
 - To create child components from the left pane on the **System Model** page, go to Step 5 on page 117.
 - To create child components from the right pane on the System Model page, go to Step 6 on page 117.
- 5. Perform the following steps to create child components from the left pane:
 - a. Click the component under which you want to create child components in the left pane.

The details of the component are displayed in the right pane.

b. Click the **Add child** icon \bigoplus in the **Children** row on the right pane.

The Add a child to... dialog is displayed.

- c. Enter a name for the component in the Name field.
- d. Select the type of component that you want to add from the following options displayed in the **Type** field.
 - Service
 - Database
 - 🚬 UI
- e. Click Add.

The child component is displayed as a circular block within the circular block of the parent component on the system model pane. The added child component is also displayed under the **Children** list under the component in the right pane.

You create child components of other types or the same type for the same or other components in the system model following the preceding steps.

- 6. Perform the following steps to create child components from the right pane of the stem model page:
 - a. Click the component name listed under the **Components** in the right pane.
 - b. Click the **Add child** icon \bigoplus in the **Children** row on the right pane.

The Add a child to... dialog is displayed.

- c. Enter a name for the component in the Name field.
- d. Select the type of component that you want to add from the following options displayed in the **Type** field.
 - 🔯 Service
 - Database
 - > UI

e. Click Add.

The child component is displayed as a circular block within the circular block of the parent component on the system model pane. The added child component is also displayed under the **Children** list under the component in the right pane.

You create child components of other types or the same type for the same or other components in the system model following the preceding steps.

Results

A component is created and it is associated as a child with the selected component and the name of the child is displayed under the **Children** section in the right pane.

What to do next

You can perform any of the following tasks:

- Publish the changes that you made to the system model. See Publishing changes to the system model on page 124.
- Create linkages between components in the system model. See Creating linkages between components on page 118.

Creating linkages between components

You can create linkages between components that display the relationship between them. The linkages can be between components or between child components of the same or different parent components.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Created child components. See Creating child components on page 116.

About this task

You can create multiple components in your system model and multiple child components under any component in the system model. You can specify the dependency among the components.

- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click **System Model** on the left navigation pane.

The **System Model** page is displayed.

- 4. Perform the following steps to create a relationship between the components in the system model:
 - a. Click the component that you want.

The details of the component are displayed in the right pane.

b. Select from the following types of relationships that you want to create:

Option	Action
Depends on	Perform the following steps, if the component you selected is dependent on another component: i. Click the Add dependency icon in the row of the Depends on in
	the right pane. The Add dependency dialog is displayed.
	ii. Select the component from the list of components displayed under Depends on.iii. Click Add.
	The components linked are listed under Depends on in the right pane. The linkage between the first to the second component you select is shown with an arrow that starts from the first and ends in the second component.
Is a dependency of	Perform the following steps, if the component you selected has a dependency of another component:
	i. Click the Add dependent icon in the row of the Is a dependency of in the right pane.
	The Add dependent dialog is displayed.
	ii. Select the component from the list of components displayed under Is a dependency of.
	iii. Click Add .

Option	Action
	The components linked are listed under Is a dependency of in the right
	pane. The linkage between the first to the second component you select is
	shown with an arrow that starts from the second and ends in the first com-
	ponent.

Results

You have created linkages between components in the system model.

What to do next

You can publish the changes that you made to the system model. See Publishing changes to the system model on page 124.

Deleting linkages between components

When you do not want to retain the linkages between components that you created in the system model, you can delete the linkages.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Created child components. See Creating child components on page 116.
- Created linkages between components in the system model. See Creating linkages between components on page 118.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click **System Model** on the left navigation pane.

The System Model page is displayed.

- 4. Perform the following steps to delete a relationship between the components in the system model:
 - a. Click the component that you want.

The details of the component are displayed in the right pane.

b. Select from the following types of relationships that you want to delete:

When	Action
The component depends on another component.	Perform the following steps, if the component you selected is dependent on another component: i. Select the component from the list of components displayed under the Depends on section in the right pane. ii. Click the Delete selected icon inline with Depends on section. The Delete relationship dialog is displayed with the details of the component and the dependent component. iii. Click Delete . The component linkage is removed from the system model pane.
The component has a dependency by another component.	Perform the following steps, if the component you selected has a dependency of another component: i. Select the component from the list of components displayed under the Is a dependency of section in the right pane. ii. Click the Delete selected icon inline with Is a dependency of section. The Delete relationship dialog is displayed with the details of the component and the component dependency. iii. Click Delete. The component linkage is removed from the system model pane.

Results

You have created linkages between components in the system model.

What to do next

You can publish the changes that you made to the system model. See Publishing changes to the system model on page 124.

Modifying components

At any point in time, after you create a component, you can modify and update the details of the components such as the component type, and the relationships with other components.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Created child components. See Creating child components on page 116.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click System Model on the left navigation pane.

The **System Model** page is displayed.

4. Click the component that you want to edit.

The component details are displayed in the right pane.

5. Perform the actions for the task to modify components as listed in the following table:

Task	Action
Change the component type.	Perform the following steps: a. Identify the component that you want to modify from the components listed under Components in the right pane. b. Click the component checkbox.
	The Edit selected icon is enabled. c. Click the Edit icon .
	The Edit component dialog box is displayed. d. Select the component type. e. Click Modify
	The type of the component is modified.
Change the name of a component.	Perform the following steps: a. Identify the component that you want to modify from the components listed under Components in the right pane. b. Click the component checkbox.
	The Edit selected icon is enabled.
	The Edit component dialog box is displayed.

Task	Action
	d. Edit the component name in the Name field.
	e. Click Modify .
	The name of the component is modified.
Change the parent of a compo-	Perform the following steps:
nent.	a. Identify the component that you want to modify from the com-
	ponents listed under Components in the right pane.
	b. Click the component checkbox.
	The Change parent icon is enabled. c. Click the Change parent icon .
	The Change parent dialog box is displayed.
	d. Select another parent for the selected components that are listed under the Parent list. e. Click Change .
	The parent of the component is changed.

Results

You have edited components and updated the details successfully.

What to do next

You can publish the changes that you made to the system model. See Publishing changes to the system model on page 124.

Deleting components

When you do not require a component, you can delete the component.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The Active projects page is displayed.

3. Click System Model on the left navigation pane.

The System Model page is displayed.

4. Click the component that you want to delete.

The component details are displayed in the right pane.

5. Click the **Delete component** icon inline with the component name.

The **Delete component** dialog is displayed.

6. Click Delete.

Results

You have deleted a component from the system model.

What to do next

You can perform any of the following tasks:

- Publish the changes that you made to the system model. See Publishing changes to the system model on page 124.
- Create components in the system model. See Creating components on page 115.

Publishing changes to the system model

When you create, delete, or modify components in a system model, the changes are saved locally and are not visible to the other project members or team space members. You must publish the system model changes to the team space repository to make your changes visible for all users of the team space.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Performed actions to add or modify the system model that you want to publish.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The Active projects page is displayed.

3. Click **System Model** on the left navigation pane.

The System Model page is displayed.

4. Perform any of the following actions:

- · Create a system model.
- Delete a system model.
- Modify a system model.
- 5. Click the See unpublished commits icon 4, and then select the Publish changes option.

Note: If you do not want to commit the changes that you made to the system model, you can select the **Discard changes** option.

6. Enter a commit message in the Description of change field, and then click Publish.

Results

You have published the changes that you made in the system model to the team space repository. Other members of the team space can now view and use the system model.

Associating resources with components

After creating components in the system model, you can navigate to a project in the team space to associate the virtual services resources in the project repositories with the components in the system model.

Before you begin

- · You must have created components.
- You must be a member of the project that contains the virtual service resources.
- 1. Click Projects.

The **Projects** page is displayed.

- 2. Click the project that contains the virtual service resources that you want to associate with components.
- 3. Click System Model.
- 4. Click the component that you want to associate with the virtual services resources.

The component details are displayed in the right pane.

5. Click the Associate tab.

The associated resources are displayed. To associate more resources, click the **Add association** icon 🕀 next to the resource type.

Note: Click the Add button to associate resources with the component for the first time.

To associate a resource with a component for the first time, you must perform the following steps:

a. Click Add.

A drop-down list is displayed.

b. Click the **Virtual Services** option if you want to associate your component with the virtual service resources.

The Associate Virtual Services page is displayed.

- You can view all the available resources of virtual services by selecting the Virtual Resources check box.
- You can use the Search field to search for virtual service resources by entering the name of the virtual service resources.
- c. Select one or more resources that you want to associate, and then click Add.

The added resources are displayed in the Associate and Overview tabs of the component.

6. **Optional**: Associate more resources by clicking the **Add association** icon + next to the resource type.

Results

You have associated components with the virtual service resources.

Viewing resources associated with components

After you associate virtual services resources with components in the system model, you can view the associated resources from the **System Model** page. You can opt to start an instance of the associated resource or stop a running instance of the associated resource.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Associated resources in a project with components in the system model. See Associating resources with components on page 125.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The Active projects page is displayed.

3. Click **Active projects > My projects > project_name** to open the project that contains the test assets.

The **Overview** page of the project is displayed.

4. Click System Model on the left navigation pane.

The **System Model** page is displayed.

5. Click the component that you associated with the resources in the project repository.

The resources associated with the component are displayed under the resource type in the **Associate** tab.

6. Click the **Overview** tab, if it is not already displayed.

The resources that are associated with the component are displayed under the **Virtual Services** section.

- 7. View and perform the actions for the **Virtual Services** resources. Go to 8 on page 127.
- 8. Identify the virtual service resource that are listed under the **Virtual Services** section, and perform the action that you want described in the following table:

Field	Description	Action
Collapse icon	You can collapse the resource sections by clicking the Collapse icon Note: When the section is collapsed, you can view the number that is displayed of the resources that are associated.	Click the icon to toggle between the collapsed and expanded display of the Virtual Services section.
Show all icon	You can opt to view the virtual services that are associated with the component either on the Resources or Instances page. You can start an instance of the virtual service from the Resources page while you can stop a running instance from the Instances page.	Perform the following steps: a. Click the Show all icon . b. Select any of the following actions: • To start an instance of the virtual service: i. Select Show all in resources page to go to the Resources page. ii. Click the Execute icon in the row of the virtual service. iii. Configure the settings for the run of the virtual service, if you want to change any of the settings, else click Execute. The virtual service starts to run. • To stop a running instance of the virtual service:

Field	Description	Action
		i. Select Show all in instances page to go to the Instances page. ii. Identify the instance that you want to stop and click the Stop icon in the Actions column of the selected virtual service instance. iii. Click Ok in the Stop virtual service instance dialog that is displayed. The running virtual service instance is stopped.
Name	You can view the name of the associated virtual service and the path in the repository.	There is no action to perform.
Instances	You can view the state of the running instance of the virtual service resource. The state is displayed as Running only if the instance is running.	There is no action to perform.
Action	You can go to the Resources page to view the virtual service resource when you click the Show resource icon You can start an instance of the virtual service from the Resources page.	Click the Show resource icon to view the virtual service on the Resources page. The virtual service resource is displayed on the Resources page.
Expand icon	You can expand the virtual service card only if the virtual service is a running instance. In the expanded card, you can view the details such as the Environment, the total number of requests received by the virtu-	Perform the following steps: a. Expand the virtual service card for a running instance. You can view the details of the instance.

Field	Description	Action
	al service, and the relative time from when the virtual service was started.	b. Click the Show instance icon to go to the Instances page to view the running instance of the virtual service.
	You can stop a running instance of the virtual service from the Instances page.	The running instance of the virtual service is displayed on the Instances page.

Results

You have viewed the resources that are associated with a component from the System Model page.

Removing resources associated with components

When you do not want to retain the resource that you associated with a component, you can delete the resource in the system model.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Associated resources in a project with components in the system model. See Associating resources with components on page 125.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click Active projects > My projects > project_name to open the project that contains the test assets.

The **Overview** page of the project is displayed.

4. Click **System Model** on the left navigation pane.

The **System Model** page is displayed.

5. Click the component that you associated with the resources in the project repository.

The resources associated with the component are displayed under the resource type in the Associate tab.

6. Select the resource that you want to remove from the component by clicking the checkbox of the resource.

You can select any or all resources for removal.

7. Click the **Delete selected** icon inline with the resource type.

The Disassociate virtual services dialog is displayed for the type of resource that you selected.

8. Click Delete.

For the changes to be reflected in the system model for all members of the project, you must publish the changes to the project repository.

- 9. Open the Changes page by clicking Author > Changes.
- 10. Verify the changes listed and then click Publish changes.
- 11. Enter a commit message in the Description of change field, and then click Publish.

Results

You have removed resources that were associated with components in the system model.

Publishing changes of associating resources with components

After you associate resources in a project with a component in the system model, you must publish the changes made to the branch in the project repository, if you want the associations to be visible to the other members in the project.

Before you begin

You must have completed the following tasks:

- Created and published the system model. See Creating a system model on page 113.
- Created components in the system model. See Creating components on page 115.
- Associated resources in a project with components in the system model. See Associating resources with components on page 125.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The Active projects page is displayed.

3. Click Active projects > My projects > project_name to open the project that contains the test assets.

The **Overview** page of the project is displayed.

4. Open the Changes page by clicking Author > Changes.

The **Changes** page is displayed. You can find the following information about the changes that you made to the system model when you associated resources with components:

- The resources that you associated with components are listed under the **Asset name** column.
- $\,{}^{\circ}$ The type of change is listed under the Changes column.
- The name of the member who made the change is displayed under the Last changed by column.
- The relative time when the change was made is displayed under the **Last updated** column.

- The number of changes that the *Edit* branch is ahead of from the project repository branch is indicated by the **commits ahead** option. You can view the details by clicking the **commits ahead** option.
- The number of changes that the *Edit* branch is behind from the project repository branch is indicated by the **commits behind** option. The *Edit* branch can be behind the project repository branch if another member has published or committed other changes in the system model to the same project repository branch. You can view the details by clicking the **commits behind** option.
- 5. Click the **Publish changes** option.

Note: If you do now want to commit the changes you made to the system model, you can select the **Discard changes** option.

6. Enter a commit message in the **Description of change** field, and then click **Publish**.

Results

You have published the changes that you made in the system model to the repository in the project. Other members of the team space can now view and use the system model.

Viewing the system model

You can view an existing system model or you can create a system model if a system model does not exist on the **System Model** page.

Before you begin

You must be a licensed user.

- 1. Log in to Rational® Test Automation Server.
- 2. Click System Model.

The **System Model** page is displayed.

- 3. Perform any of the following actions:
 - Add a team space repository, if no repository is configured as the team space repository.
 - Create a system model, if no model is created or exists.
 - View the system model that exists.
 - Modify the existing system model.

Results

You have viewed an existing system model from the **System Model** page.

Deleting a system model

When you want to remove an existing system model to create a new system model, you can delete the existing system model.

Before you begin

You must have ensured that a system model exists in the Initial Team Space.

- 1. Log in to Rational® Test Automation Server.
- 2. Click System Model.

The System Model page is displayed.

- 3. Click the **Open action menu** icon in the right-pane.

The Delete System Model dialog is displayed.

5. Click Delete.

Results

You have deleted the system model from the team space repository.

What to do next

You must publish the changes to the team space repository. See Publishing changes to the system model on page 124.

Deleting a repository that is added to a team space

You can delete a repository that you added to the team space when you do not want to use a team space repository.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as a *Team Space Owner* or an *Architect* in the team space. See Managing members and their roles in a team space on page 358.
- Added a repository to the team space. See Adding a repository to a team space on page 111.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the team space to which a team space repository is added.

The **Active projects** page is displayed.

3. Click the **Settings** icon from the left navigation pane, and then select **Manage team space**.

The **Details** page is displayed.

4. Click **Repository** on the left navigation pane.

The **Repository** page is displayed.

- 5. Click the Open action menu icon 1.
- 6. Click Delete in the action menu list.

The **Delete repository** dialog is displayed.

7. Select the I understand... checkbox, and then click Delete.

Results

You have deleted the ream space repository.

Restriction: When you delete the team space repository, the system model if created is also deleted, and you or other members of the team space cannot add a system model.

Prerequisites to running tests

Before you can configure and run a test in a project on Rational® Test Automation Server, you must read the information about the different tests. You might want to add a remote static agent or a remote Docker host to the project as an alternate location to run the tests.

You can find the following information:

Related information

Tests configurations and test runs

Test run considerations for AFT Suites

Before you configure an AFT Suite run, you must read the considerations you must take into account.

When you want to run an AFT Suite from a project on Rational® Test Automation Server, you can check if the AFT Suite meets any of the following conditions:

If	Then
The AFT Suite uses the settings configured in an AFT XML file for a remote agent	You must ensure that you have configured the location element in the AFT XML to point to a remote agent. For more information about setting the location element, refer to Using an XML file to run multiple Web UI tests and compound tests simultaneously.
You want to run an AFT Suite on a remote agent	You must run the test on the remote agent before you commit the test asset to the remote repository. When you run the test on the remote agent, the following events occur:

If	Then
	 The agent is added as the location in the AFT XML file, on which the test is to be run. The agent is displayed as the agent on which the test is to be run, under the Host column within the Location tab in the Execute test asset dialog box.
You commit the test asset to the remote repository without running the test on the remote agent	The agent is not displayed under the Host column within the Location tab in the Execute test asset dialog box.

Before you configure the run for an AFT Suite, you must complete the following tasks, if they are applicable:

- Add the remote agents, on which the test is to be run, to the project on Rational® Test Automation Server. See Adding an agent to a project on page 142.
- After you add the agent, you can select the agent configured in the AFT XML file as the location for the test run or select the remote agents that you add to the project, when you configure a run for an AFT Suite.

The remote agents are shown as the agents available for selection under the **Override** column within the **Location** tab in the **Execute test asset** dialog box.

You can then select the remote agent as the location to run the AFT Suite when you are configuring the test run. Alternatively, you can enter the argument -swaplocation <configured_agent_location>:<overriding_agent_location> in the **Program Arguments** field in the **Advanced**Setting dialog box when you are configuring the test run.

For running an AFT Suite, see Configuring an AFT Suite run on page 164.

Test run considerations for API Suites

Before you configure an API Suite run, you must read the considerations you must take into account.

You can find the following information about API Suites:

- Important information about API Suites on page 135
- Important information about report configuration in API Suites on page 137

Important information about API Suites

When you want to run an API Suite from a project on Rational® Test Automation Server and the test suite in Rational® Integration Tester meets any of the following conditions:

- The test suite refers to local stubs that use a transport other than HTTP or MQ.
- The test suite refers to local stubs that use the HTTP transport.
- The transport used in the tests in the test suite is configured with the host name set to *localhost* for the HTTP/ TCP proxy.
- The test suite has tests that use a transport and the transport requires third-party application Jar files for a successful run.

You must then refer to the following table for the next steps:

If	Then
The tests in an API Suite refer to local stubs that use a	You must perform any of the following actions before
transport other than HTTP or MQ.	you commit the test asset to the remote repository:
	 Remove the reference to the local stub from the test suite. Publish the stubs to Rational® Test Control Panel. To publish and edit stubs, see Publishing stubs.
The tests in an API Suite refer to local stubs that use the	You must perform the following actions before you com-
HTTP transport.	mit the test asset to the remote repository:
	 Create a test suite that contains the stub and tests that run on the stub. Configure the physical HTTP transport with the following parameters in the Client tab in the Physical View: Set the Host name or IP address of the HTTP Proxy server in the Proxy Host field. Set 3128 as the proxy server port in the Proxy Port field. Set the reference to the stub for the tests in the test suite scenario from the Scenario Editor dialog box from the Test Factory view by selecting
	the Live system option in the Satisfied by column

If	Then
	to run the stubs on the HTTP proxy registered with Rational® Test Automation Server. 4. Save the project.
The transport used in the tests in an API Suite is configured with the host name set to <i>localhost</i> for the HTTP/TCP proxy.	You must replace the host name with fully-qualified-do- main-name or IPAddress of the proxy host in the tests be- fore you commit the test asset to the remote repository.
You plan to run the API Suite on the computer where Rational® Test Automation Server is installed and the API Suite contains tests that use a transport from any of the following third-party applications: Camel CentraSite CICS Coherence Database IMS Integra JMS SAP RFC Software AG Universal Messaging TIBCO EMS TIBCO Rendezvous TIBCO SmartSockets WebSphere Application Server Service Integration Bus (SiBus) WebLogic Software AG webMethods	You must complete the following tasks: 1. Identify the location of the third-party application JAR files. You can use Library Manager to know the location where the third-party application JAR files are saved. 2. Copy the third-party application JAR files to the computer where Rational® Test Automation Server is installed. See Copying third-party application Jars to Kubernetes on page 73.
You plan to run the API Suite on a remote Docker host and the API Suite contains tests that use a transport from any of the following third-party applications:	You must complete the following tasks:

If	Then
 Camel CentraSite CICS Coherence Database IMS Integra JMS SAP RFC Software AG Universal Messaging TIBCO EMS TIBCO Rendezvous TIBCO SmartSockets WebSphere Application Server Service Integration Bus (SiBus) WebLogic Software AG webMethods WebSphere MQ 	 Identify the location of the third-party application JAR files. You can use Library Manager to know the location where the third-party application JAR files are saved. Copy the third-party application JAR files to the computer where the remote Docker host is in- stalled. See Copying third-party application Jars to a remote Docker host on page 151.

Important information about report configuration in API Suites

You must configure test suites in Rational® Integration Tester to use a results database so that the details of the test results can be captured and displayed in the Rational® Test Automation Server API results reports. See Configuring the project results database.

If your server projects use either a Microsoft SQL Server, MYSQL, or both as a project results database, you must copy the Microsoft SQL Server and MySQL database JAR files to the JDBC folder in the path /data/JDBC on IBM® Rational® Test Automation Server. See Copying third-party application Jars to Kubernetes on page 73.

The database JAR files that you need are based on the version of Microsoft SQL Server or MQSQL that you use with Rational® Integration Tester. See Adding Microsoft SQL Server and MySQL drivers.

To run an API Suite, see Configuring an API Suite run on page 171.

Test run considerations for schedules

Before you configure a Rate Schedule or VU Schedule run, you must read the considerations that you must take into account.

Important information about JMeter tests in schedules

When you want to run JMeter tests as part of the VU Schedule or Rate Schedule on Rational® Test Automation Server, you must have completed the following tasks:

- Installed the IBM® Rational® Performance Tester Agent on a computer.
- Installed the JMeter application on the computer where you have installed the IBM® Rational® Performance
 Tester Agent.
- Set the environment variable JMETER_HOME that points to the JMeter installation directory.

Important information about Resource Monitoring sources in schedules

When you want to run schedules on Rational® Test Automation Server, you must have completed the following tasks in Rational® Performance Tester:

- Created a performance schedule of Rate or VU type.
- Added Resource Monitoring sources, or the labels of Resource Monitoring sources to a schedule. Refer to Adding resource monitoring sources to a performance schedule by using labels.

Before you configure a run of a Schedule, you must complete the following tasks in Rational® Test Automation Server:

- Add Resource Monitoring sources to your project in Rational® Test Automation Server. See Monitoring host resources on page 282.
- Enable Rational® Test Automation Server as Resource Monitoring service only if you want to replace
 Resource Monitoring labels set in Rational® Performance Tester with the labels that you created in Rational®
 Test Automation Server. See Controlling Resource Monitoring sources in a schedule.
- Perform the following steps when you want to override the Resource Monitoring labels in the test asset with the Resource Monitoring labels that you create in Rational® Test Automation Server:
 - 1. Click the Resource Monitoring tab.

Note:

The **Resource Monitoring** tab displays only if you enabled the **Resource Monitoring from Service** option in Rational® Performance Tester when you created the test asset.

2. Click the list.

You can select or add labels only if you added the labels in the **Resource Monitoring Sources** page in Rational® Test Automation Server.

For running a Rate Schedule or VU Schedule, see Configuring a run of a Rate Schedule or VU Schedule on page 210.

Considerations for using Jaeger traces in reports

Before you can use Jaeger to report the test results in the supported tests, you must read the considerations that you must take into account.

When you want to enable Suites, Tests, or Schedules that are run from Rational® Test Automation Server to use Jaeger traces for reporting the test results, you must have completed the following tasks:

- Installed Jaeger at the time of installation of the server software. See Prerequisites for installing the server software on Red Hat OpenShift on page 26 or Prerequisites for installing the server software on Ubuntu on page 35.
- · Verified that Jeager is enabled and working.

After you install and verify that Jaeger is enabled, and when you want Jaeger to report the test results for the tests that you configure for a run, you must perform the following steps:

- 1. Click Advanced.
- 2. Enter -history jaeger in the Program Arguments field.

Tests configurations and test runs

Agents overview

You can find information about the agents that you must install on remote computers and configure the agents with the offline user token so that the agents register with IBM® Rational® Test Automation Server. After the agents are registered, you can add them to your projects and then select them as locations to run tests.

When you plan to run any of the tests on a remote agent from a project on Rational® Test Automation Server, you must have completed the following tasks:

- Installed the agent of the same version as the version of Rational® Test Automation Server.
- Configured the agent with your offline user token so that the agent can connect and also register with Rational® Test Automation Server.

Note: When you configure the agent to connect to the server by using the offline user token that you generated on Rational® Test Automation Server, you become the owner of the agent.

• Verified that you have write permissions to the majordomo.config file so that certain transactions can be written by Rational® Test Automation Server to the majordomo.config file.

Note: You can verify if you have the *Read* and *Write* permissions by checking the properties of the majordomo.config file.

- Viewed the agents that are registered with Rational® Test Automation Server. See Viewing agents that are registered with Rational Test Automation Server on page 141.
- Added the remote agents that are registered with Rational® Test Automation Server to your project on Rational® Test Automation Server. See Adding an agent to a project on page 142.

Note: After you add the remote agents to your project, Rational® Test Automation Server determines the capabilities that are provided by the remote agent and displays the details and capabilities of the agent on the **Infrastructure** page. You can also define the capabilities that you want to add, and then view, edit, or delete the capabilities that you defined for the agents in your project. See Working with agent capabilities on page 144.

Test run considerations for running tests on remote agents

Before you configure a test to run on a remote agent from IBM® Rational® Test Automation Server, you must read the considerations that you must take into account.

Supported tests

You can run the following tests that are supported to be run on a remote agent:

- AFT Suite
- Compound Tests that contains performance tests
- · Compound Tests that contains Web UI tests
- · Compound Tests that contains traditional HTML tests

- · Rate Schedule
- VU Schedule

Prerequisite tasks

Before you can run any of the supported tests on a remote agent from a project on Rational® Test Automation Server, you must have completed the following tasks:

- Installed the agent on the remote computer. See Agents overview on page 139.
- Configured the agent with your offline user token so that the agent can connect to Rational® Test Automation Server.
- Added the remote agents to your project on Rational® Test Automation Server. See Adding an agent to a
 project on page 142.

Note: If you want to run an AFT Suite (that contains Web UI tests) on an agent, you must start the agent as a non-admin user so that certain browsers that are configured start correctly during the test run time.

Before you add the tests to the remote repository, you must have completed the following tasks:

- · Associated the agents with the performance schedule in Rational® Performance Tester.
- Specified the host name of the remote workstation in the AFT XML file.

You can continue to configure a run for any of the following supported test types:

- Configuring an AFT Suite run on page 164
- Configuring a run of a Compound Test that contains performance tests on page 203
- Configuring a run of a Compound Test that contains Web UI tests on page 186
- Configuring a run of a Compound Test that contains HTML tests on page 178
- Configuring a run of a Rate Schedule or VU Schedule on page 210

Viewing agents that are registered with Rational® Test Automation Server

After you install the remote agents and configure them with your offline user token, the agents register with Rational® Test Automation Server and you can view the registered agents on the **Agents and Intercepts** page.

Before you begin

You must have completed the following tasks:

- Installed the agent of the same version as the version of Rational® Test Automation Server.
- Configured the agent with your offline user token so that the agent can register with Rational® Test Automation Server.

Note: When you configure the agent to connect to the server, you must specify the offline user token that you generated on Rational® Test Automation Server. This token defines your ownership over the agent.

- 1. Log in to Rational® Test Automation Server.
- Click Infrastructure > Agents and Intercepts in the navigation pane.

The Agents and Intercepts page is displayed.

You can view the agents, intercepts or Dockers that are registered with Rational® Test Automation Server.

- 3. You can view the agents that you own in any of the following ways:
 - Search for the agent by entering the name of the agent in the **Search** field.

Note: You can enter either the full name or any text that is in the name. The search is enabled for case sensitive text that you can enter.

- Sort the **Type** column to sort the items and display the agents in the rows at the top of the table.
- Sort the **Agents** column and identify the agents by their names or by their owner.

You can view the following details about the agents that are registered with Rational® Test Automation Server:

- The projects to which the agent is added, are displayed in the **Projects** column.
- The status of the agent is displayed in the Status column.

Note: You can add agents that are in the Ready state to your project, and then use them as locations to run tests.

Results

You have viewed the registered agents from the Agents and Intercepts page.

What to do next

You can add the agents that you own to your project. See Adding an agent to a project on page 142.

Adding an agent to a project

If you have performance tests that distribute workload across different workstations or Accelerated Functional Testing (AFT) Suites that need to run on different platforms and browsers, you can add IBM® Rational® Performance Tester Agents to your projects to run tests on remote workstations.

Before you begin

You must have completed the following tasks:

- Read about the considerations that you must take into account before you configure a test run to run on a remote agent. See Test run considerations for running tests on remote agents on page 140.
- Been assigned the Owner or Tester role in the project to which you want to add the agent.
- Owned at least one agent that is not added to the project.

About this task

Only you can add or remove this agent from the project. However, any member of your project with the permission to run the tests can initiate the run of the performance schedule and AFT Suites that are associated with the agent.

- 1. Log in to Rational® Test Automation Server, open your project, and click **Manage > Infrastructure** to go to the **Infrastructure** page.
- 2. Click Add > Add agent.

The agents that you configured with your user token are displayed.

3. Select the agents that you want to use and click Add.

The agents that you added are displayed.

- 4. Perform the following steps to view details and capabilities of the agents:
 - a. Expand the agent to view the details panel.

You can find the following details of the agent displayed:

Parameter	Description	
Version	The version of the installed agent.	
Address	The IP address of the computer on which the agent is installed.	
License type	The license type that is enabled for you to use the agent.	
Load generation service	The status of the agent whether it can be used for load generation service.	
Last contact	The time of the last contact with the agent by Rational® Test Automation Server.	

b. Expand the capabilities panel to view the system and application capabilities.

You can find the following capabilities of the agent displayed:

	Capability	Description
System capabilities	Architecture	The architecture of the CPU processor of the computer
		on which the agent is installed.

	Capability	Description
	Operating system	The operating system of the computer on which the agent is installed.
	RAM	The memory that is allotted to RAM in the computer on which the agent is installed.
Application capabilities	Browser	The browsers along with their version that are installed on the computer on which the agent is installed.
User Defined capabilities	User defined	The capabilities that you add for an agent. You can also tag an agent so that you can identify the agent to select as a location.

c. Check for the status of the agent from the Status column.

Note: You can add agents that are in any state to the project.

Results

You have added remote agents to your project and viewed the agent capabilities displayed for each agent that you own.

What to do next

You can perform any of the following tasks:

- Run the tests on the agent that is added to the project from the Execution page. See Test run configurations
 on page 162.
- Define the capabilities that you want to add, and then view, edit, or delete the capabilities that you defined for the agents in your project. See Working with agent capabilities on page 144.

Working with agent capabilities

When you have installed static agents V10.1.2 or later, and added them to your project, you can view capabilities of the agents from the **Infrastructure** page. When you have installed static agents V10.1.3 or later, you can add, view, edit, or delete capabilities of agents from the **User Defined** panel of that agent.

Before you begin

You must have completed the following tasks:

- Been assigned the *Owner* or *Tester* role in the project to which you want to add the agent.
- Owned at least one agent that is not added to the project.
- Installed the agent V10.1.3 or later. See Test run considerations for running tests on remote agents on page 140.
- Added agents to your project. See Adding an agent to a project on page 142.

1. Log in to Rational® Test Automation Server, open your project, and click **Manage > Infrastructure** to go to the **Infrastructure** page.

The agents that you added to your project are displayed.

2. Expand the agent.

The **Details** and **Capabilities** tabs are displayed.

- 3. Click **Capabilities** to view the capabilities of the agent.
- 4. Click **User Defined** to view the capabilities that you can add, view, edit, or delete.
- 5. Complete the steps for the task that you want to perform as listed in the following table:

Task	Action
Adding a capability	
	a. Click Add new .
	b. Enter the name of the capability in the Name field.
	c. Enter the value of the capability in the Value field.
	d. Click Save .
	The capability that you add is displayed.
Viewing capabilities that you added	The User Defined Capabilities panel displays the capabilities
	that you have added to the selected agent.
Editing capabilities that you added	
	a. Click on the row of the capability that you want to
	edit.
	b. Edit the name of the capability in the Name field or the
	value of the capability in the Value field or edit both
	fields.
	c. Click OK .
	The updated capability of the agent is displayed.
Deleting capabilities that you added	_
	a. Click 🔟 in the row of the capability that you want to
	delete.
	b. Click Delete .
	The capability that you selected is deleted.

Results

You have added, viewed, edited, or deleted the capability of an agent.

What to do next

You can run the tests on the agent from the Execution page. See Test run configurations on page 162.

Managing Docker hosts

You can find information about the tasks that you can perform on remote Docker hosts. After you set up a remote Docker host, you can register the Docker host with IBM® Rational® Test Automation Server. You must add the registered remote Docker host to your project before you can run tests on the remote Docker host location.

Test run considerations for running tests on remote Docker hosts

Before you can configure a test to run on a remote Docker host, you must read the considerations that you must take into account.

You can run all the tests that are supported on Rational® Test Automation Server on remote Docker hosts.

Important: You can run virtual services only in the **Default Cluster** location of Rational® Test Automation Server. You cannot run virtual services on a remote Docker host.

When you plan to run any of the tests on a remote Docker host from a project on Rational® Test Automation Server, you must complete the following tasks:

	Tasks	For information, go to
1.1	Set up non-secure remote Docker hosts.	Setting up a remote Docker host computer on page 147
1.2	Set up secure remote Docker hosts.	Setting up a secure remote Docker host computer on page 149
2	Register the remote Docker host on Rational® Test Automation Server.	Registering a remote Docker host with IBM Rational Test Automation Server on page 153
3	View the registered Docker hosts.	Viewing remote Docker hosts that are registered with IBM Rational Test Automation Server on page 155
4	Add a remote Docker host to the Rational® Test Automation Server project.	Adding a remote Docker host to the project for running tests on page 156

	Tasks	For information, go to
5	Configure a run for your test that you want to run on the remote Docker host by performing the following actions: 1. Go to Test run configurations on page 162.	 Test run configurations on page 162 Prerequisites to running tests on page 133 Test run configurations on page 162
	2. Check for the prerequisite tasks that you must perform before you configure a test run for the test.3. Select the task for the test that you want to configure for a run, and then follow the steps to run the test.	

If you plan to run API Suites that use a transport and the transport requires third-party application Jar files for a successful run on a remote Docker host, then you must perform the following task:

You must copy the third-party application Jax files to the third-party application folder on the computer where
the remote Docker host is installed. See Copying third-party application Jars to a remote Docker host on
page 151.

After you set up and register the remote Docker host with Rational® Test Automation Server, you can add the remote Docker hosts to your project on Rational® Test Automation Server. See Adding a remote Docker host to the project for running tests on page 156.

Managing Docker hosts on page 146

Setting up a remote Docker host computer

You must set up a computer to host the remote Docker host. You can set up the remote host with a non-secure mode of connection with IBM® Rational® Test Automation Server.

Before you begin

You must have identified a remote computer or VM that has a minimum of 16 GB RAM. You must have installed Ubuntu V18.04 or later, on the remote computer.

You must have installed Docker Enterprise Edition for a non-secure mode of connection with IBM® Rational® Test Automation Server on the remote Docker host computer. Refer to Get Docker Engine.

You must have the entitlement key that is required for you to connect to the IBM Docker images library to be able to pull in the software image to the remote Docker host.

About this task

You must set up a remote computer or a Virtual Machine (VM) on which you want to set up the remote Docker host. You must be a system administrator or get the remote Docker host set up by a system administrator. You must ensure that the system administrator completes the following actions:

- · Enables SSH.
- Creates user credentials for you with root permissions.
- · Provides the name of the Docker container.
- Provides the IP address of the remote Docker host computer.
- 1. As a system administrator of the remote system, specify a port to access the Docker daemon in the docker.service file located in the directory /lib/systemd/system. You must add the configured port at the line in the file:

```
ExecStart=/usr/bin/dockerd -H fd:// -H tcp://0.0.0.0:PORT
```

For example, if the port configured is 4342, then the line must read as:

```
ExecStart=/usr/bin/dockerd -H fd:// -H tcp://0.0.0.0:4342
```

2. Restart the Docker service by using the following commands:

\$ sudo systemctl daemon-reload

\$ sudo systemctl restart docker

- 3. Perform the following steps as a user with root permissions or ask the system administrator to complete the following steps:
 - a. Open a terminal and connect to the remote Docker host by using an SSH tool by running the following command:

```
ssh root@<IP_address_of_remote_host>
```

b. Log in to IBM Docker images library by running the following command:

sudo docker login cp.icr.io -u <username> -p <password>

Note: You must provide the following username and password in the command to log in to the registry:

- Username as cp
- Password as <entitlement_key>
- c. Run the following commands to pull the product images from the registry on to the remote Docker host computer:

Note: You must pull in the images with the version which is the same as the version of IBM® Rational® Test Automation Server that you use to run the tests.

- sudo docker pull cp.icr.io/cp/<ibm-rtw_docker_image>
- sudo docker pull cp.icr.io/cp/<ibm-rtvs_docker_image>

Results

You have set up the remote Docker host computer that can be accessed in a non-secure mode.

What to do next

You can set up a secure remote Docker host computer optionally, that enables a secure connection with Rational® Test Automation Server. See Setting up a secure remote Docker host computer on page 149.

You can register the remote Docker host on Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.

Setting up a secure remote Docker host computer

You must set up a computer to host the remote Docker host. You can set up the remote host with a secure mode of connection with IBM® Rational® Test Automation Server by using certificates issued by the remote host computer that authenticate the connection.

Before you begin

You must have identified a remote computer or VM that has a minimum of 16 GB RAM. You must have installed Ubuntu V18.04 or later, on the remote computer.

You must have installed Docker Community Edition V18.09 or later. For instructions, refer to Get Docker Engine.

Note: For the remote Docker host to be reached in a safe manner through the network, you can enable *TLS* by specifying the **tlsverify** flag and by pointing the **tlscacert** flag of the remote Docker host to a trusted CA certificate. Refer to Protect the Docker daemon socket.

You must have the entitlement key that is required for you to connect to the IBM Docker images library to be able to pull in the software image to the remote Docker host.

About this task

You must set up a remote computer or a Virtual Machine (VM) on which you want to set up the remote Docker host. You must be a system administrator or get the remote Docker host set up by a system administrator. You must ensure that the system administrator completes the following actions:

- · Enables SSH.
- Creates user credentials for you with root permissions.
- Provides the name of the Docker container.
- Provides the IP address of the remote Docker host computer.

Perform the following steps as a user with root permissions or ask the system administrator to complete the following steps:

a. Open a terminal and connect to the remote Docker host by using an SSH tool by running the following command:

ssh root@<IP_address_of_remote_host>

b. Log in to IBM Docker images library by running the following command:

sudo docker login cp.icr.io -u <username> -p <password>

Note: You must provide the following username and password in the command to log in to the registry:

- · Username as cp
- Password as <entitlement_key>
- c. Run the following commands to pull the product images from the registry on to the remote Docker host computer:

Note: You must pull in the images with the version which is the same as the version of IBM® Rational® Test Automation Server that you use to run the tests.

- sudo docker pull cp.icr.io/cp/<ibm-rtw_docker_image>
- sudo docker pull cp.icr.io/cp/<ibm-rtvs_docker_image>

Results

You have set up the remote Docker host computer that can be accessed in a secure mode.

What to do next

You can optionally, set up a non-secure remote Docker host. See Setting up a remote Docker host computer on page 147.

You can register the remote Docker host on Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.

Task flow for working with remote Docker hosts

Copying third-party application Jars to a remote Docker host

You can run API Suites in a project on Rational® Test Automation Server on a remote Docker host. If the API Suites use a transport and the transport requires third-party Jax files for a successful run, you must ensure that the third-party application Jax files are available at the test run time. To achieve this, you must copy the third-party application Jax files to the computer where you have set up the remote Docker host.

Before you begin

If you want to copy the third-party application Jar files to the to the computer where Rational® Test Automation Server is installed on Kubernetes, see Copying third-party application Jars to Kubernetes on page 73.

You must have server administrator privileges.

You must have completed the following tasks:

- Set up and configured the remote Docker host. See Managing Docker hosts on page 146.
- Identified the third-party application Jar files that are required and copied the Jar files. See Test run considerations for API Suites on page 134.
- Copied the Jar files of the third-party application jars to the directory or folder on the remote Docker host from where you can run the docker commands.

About this task

You can copy the required third-party application Jar files to the folder that is specific for the application under the /myFiles/Userlibs/<application_name> folder. You need not extract the files.

You can perform this task any time after you have configured the remote Docker host and you plan to run an API Suite on the remote Docker host. The API Suite uses transports and the transports require third-party application JAR files to be available at the test run time.

You can get help on the docker commands by running the command: \$ docker help from the docker command line. For more information about the docker commands, refer to the Docker command line documentation.

1. Use the following table to find the name of the folder that corresponds to the specific third-party application for the transport used in the API Suite.

Note: You must provide the name of the folder listed for the third-party application as the <application_name> in the docker command.

Table 4. Name of the folder for the application

Application	Name of the folder to use
Camel	Camel
CentraSite	CentraSite
CICS	CICS
Coherence	Coherence
Database	JDBC
IMS	IMS
Integra	Integra
JMS	JMS
SAP RFC	SAP
Software AG Universal Messaging	SoftwareAGUM
TIBCO EMS	TIBCO
TIBCO Rendezvous	
TIBCO SmartSockets	
WebSphere Application Server Service Integration Bus (SiBus)	WAS
WebLogic	WebLogicJMX
Software AG webMethods	webMethods
WebSphere MQ	WMQ

2. Run the following docker command to create or update the volume that contains the application Jar files:

docker run --rm -v /<anyFolder>/UserLibs/<application_name>:/ulsrc -v userlibs/<application_name>:/uldest
alpine:latest cp -r /ulsrc/. /uldest/UserLibs/<application_name>

Attention: You must run the docker command when no other tests are running in the Docker host to prevent concurrent access problems.

Results

You have successfully copied the third-party application Jar files to the folder in the remote Docker host.

What to do next

- You can register the remote Docker host, if you have not already done so. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.
- You can configure the API Suite run. See Configuring an API Suite run on page 171.

Registering a remote Docker host with IBM® Rational® Test Automation Server

You must register the remote Docker host with Rational® Test Automation Server before you add the remote Docker host to your project, which contains the test assets that you want to run on the remote Docker host.

Before you begin

Depending on the mode of connection with Rational® Test Automation Server, you must have set up the remote Docker host computer either for a secured mode or for an unsecured mode of connection. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.

- 1. Log in to Rational® Test Automation Server.
- 2. Click Infrastructure > Agents and Intercepts in the navigation pane.

The Agents and Intercepts page is displayed.

You can view the agents, intercepts or Dockers that are registered with Rational® Test Automation Server.

3. Click New docker host.

The New docker host dialog box is displayed.

4. Enter the *host name* and the *port* of the remote Docker host in the format *<host name or IP_address>:<port>* in the **Remote Docker Host** field.

If you do not provide the port that you configured for the remote Docker host, then the default port that is used is as follows:

- Port 2375 for the unsecured mode
- Port 2376 for the secured mode
- 5. Choose from any of the following authentication modes to establish the connection between Rational® Test Automation Server and the remote Docker host computer:
 - For the secured mode, which is the default mode and the checkbox is displayed as selected.

Perform the following steps:

- a. Select Secure mode, if it is not selected.
- b. Click the action labels to browse and select the .pem files that correspond to ca_certificate.pem, client_certificate.pem, and client_key.pem.

Note: You must have generated the . pem files on the remote Docker host computer and copied the files to your local drive.

• For the unsecured mode, the **Secure mode** checkbox must not be selected.

Perform the following step:

- a. Clear the Secure mode checkbox, if selected.
- Click **Test connection** to test if a connection is established between Rational® Test Automation Server and the remote host computer.

Any of the following events occur when Test connection is clicked:

- On a successful connection, a message is displayed.
- On a failure to connect to the remote host computer, an error message is displayed. You must resolve
 the error and reattempt to establish a successful connection.
- Important: The remote Docker host computer must be connected successfully before you register the remote Docker host with Rational® Test Automation Server.

7. Click Register.

The remote Docker host that you registered is displayed.

Important: The remote Docker host must be registered successfully with Rational® Test Automation Server before you add the remote Docker host to your project.

8. Click Close to exit.

Results

You have registered the remote Docker host with Rational® Test Automation Server.

What to do next

You can view the Docker hosts that are registered with Rational® Test Automation Server. See Viewing remote Docker hosts that are registered with IBM Rational Test Automation Server on page 155.

You must add the registered remote Docker host to your project before you use the remote Docker host as a location to run tests in your project. See Adding a remote Docker host to the project for running tests on page 156.

Related reference

Task flow for working with remote Docker hosts

Viewing remote Docker hosts that are registered with IBM® Rational® Test Automation Server

You must register the remote Docker host with Rational® Test Automation Server before you add the remote Docker host to your project, which contains the test assets that you want to run on the remote Docker host.

Before you begin

Depending on the mode of connection with Rational® Test Automation Server, you must have set up the remote Docker host computer either for a secured mode or for an unsecured mode of connection. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.

- 1. Log in to Rational® Test Automation Server.
- 2. Click **Infrastructure > Agents and Intercepts** in the navigation pane.

The Agents and Intercepts page is displayed.

You can view the agents, intercepts or Dockers that are registered with Rational® Test Automation Server.

- 3. You can view the Dockers that you own in any of the following ways:
 - Search for the Docker by entering the name of the Docker host in the **Search** field.

Note: You can enter either the full name or any text that is in the name. The search is enabled for case sensitive text that you can enter.

- Sort the Type column to sort the items and then identify the Docker by the name displayed.
- Sort the **Agents** column to sort the items and identify the Docker by the owner.

You can view the following details about the Dockers that are registered with Rational® Test Automation Server:

- The projects to which the Docker host is added, are displayed in the **Projects** column.
- The status of the Docker host is displayed in the Status column.

Note: You can add Docker hosts that are in the Ready state to your project, and then use them as locations to run tests.

Results

You have viewed the remote Docker hosts that are registered with Rational® Test Automation Server.

What to do next

You must add the registered remote Docker host to your project before you use the remote Docker host as a location to run tests in your project. See Adding a remote Docker host to the project for running tests on page 156.

Adding a remote Docker host to the project for running tests

You can choose to run tests on Docker hosts that you have set up on remote host computers. You must register the Docker host with IBM® Rational® Test Automation Server and then add them to your project before you run tests on the remote Docker hosts.

Before you begin

You must have completed the following tasks:

- Read about the considerations you must take into account before you configure a test run to run on a remote Docker host. See Test run considerations for running tests on remote Docker hosts on page 146.
- Set up the remote Docker host system. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.
- Registered the remote Docker host with IBM® Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.
- 1. Log in to Rational® Test Automation Server.
- Open your project by clicking Projects > My Projects > project_name.
 The Overview page is displayed.
- 3. Click Manage > Infrastructure.

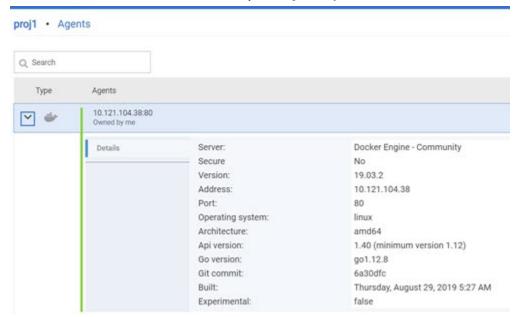

The Infrastructure page is displayed.

- 4. Click Add > Add docker.
- 5. Select the Docker host that you want to add to the project from the list of Docker hosts, and then click Add.

Note: You can add the Docker hosts that you have registered. You can add any number of Docker hosts to your project.

The Docker hosts that you added to the project are displayed.

You can view the details of the Docker host by clicking the **Expand** icon \geq .

What to do next

You can select any of the remote Docker hosts as an alternate location to run the test asset in your project while configuring a test run from the **Execution** page.

Editing configurations of a remote Docker host

You can edit the host name or the port of the registered Docker host computer instead of registering it as a new remote host if any of the parameters are changed on the remote host computer. You can also change the mode of authentication of a registered remote Docker host.

Before you begin

You must have completed the following tasks:

- Set up the remote Docker host computer. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.
- Registered the remote Docker host with IBM® Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.

1. Log in to Rational® Test Automation Server.

The My Projects page is displayed.

2. Click Infrastructure > Agents and Intercepts in the navigation pane.

The **Agents and Intercepts** page is displayed.

You can view the agents, intercepts or Dockers that are registered with Rational® Test Automation Server.

- 3. You can view the Dockers that you own in any of the following ways:
 - Search for the Docker by entering the name of the Docker host in the **Search** field.

Note: You can enter either the full name or any text that is in the name. The search is enabled for case sensitive text that you can enter.

- \circ Sort the **Type** column to sort the items and then identify the Docker by the name displayed.
- Sort the **Agents** column to sort the items and identify the Docker by the owner.

You can view the following details about the Dockers that are registered with Rational® Test Automation Server:

- The projects to which the Docker host is added, are displayed in the **Projects** column.
- The status of the Docker host is displayed in the **Status** column.
- 4. Identify the Docker host that you want to modify the configuration, and then click the **Edit** icon 2.

Note: The icon is displayed in the Actions column in the row of the Docker only if you own the remote Docker host.

The **Update docker host** dialog box is displayed.

5. Change any of the configurations.

To change	Do this
Change the host name or the port of the remote Docker host.	Enter the changed value of the host name or the port in the Remote hostname field.
Change the mode of authentication from a non-secure mode to a secure mode.	 a. Select the Secure mode option. b. Click the action labels to browse and select the .pem files that correspond to ca_certificate.pem, client_certificate.pem, and client_key.pem.

To change	Do this
	Note: You must have generated the .pem files on the remote host computer and copied the files to your local drive.
Change the mode of authentication from a secure mode to a non-secure mode.	Clear the Secure mode option that is selected.

- 6. Click **Test connection** to test whether a connection is established between Rational® Test Automation Server and the remote host computer:
 - On a successful connection, a message is displayed.
 - On a failure to connect to the remote host computer, an error message is displayed. You must resolve
 the error and reattempt to establish a successful connection.
- 7. Click Update.

The remote Docker host with the updated details is displayed.

Results

You have updated the registered remote Docker host with the changed parameters.

What to do next

You can now add the updated Docker host to your project.

Removing a remote Docker host from a project

You can delete a remote Docker host that you added to your project in IBM® Rational® Test Automation Server when you no longer need it to run tests.

Before you begin

You must have completed the following tasks:

- Set up the remote Docker host computer. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.
- 2. Registered the remote Docker host with Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.
- 3. Added the registered Docker host to a project. See Adding a remote Docker host to the project for running tests on page 156.
- 1. Log in to Rational® Test Automation Server.

The **My Projects** page is displayed.

2. Click Manage > Infrastructure in the navigation pane.

The **Infrastructure** page is displayed.

You can view the agents, intercepts or Dockers that are added to your project.

- 3. You can view the Dockers that you own in any of the following ways:
 - Search for the Docker by entering the name of the Docker host in the **Search** field.

Note: You can enter either the full name or any text that is in the name. The search is enabled for case sensitive text that you can enter.

- Sort the **Type** column to sort the items and then identify the Docker by the name displayed.
- Sort the **Agents** column to sort the items and identify the Docker by the owner.

You can view the following details about the Dockers that are registered with Rational® Test Automation Server:

- The projects to which the Docker host is added, are displayed in the **Projects** column.
- The status of the Docker host is displayed in the **Status** column.
- 4. Identify the Docker host that you want to delete, and then click the **Remove docker host** icon ...

Note: The ill icon is displayed in the **Actions** column in the row of the Docker only if you own the remote Docker host.

A message is displayed that the Docker host is removed from the project successfully.

Results

You have deleted the remote Docker host from your project. The remote Docker host is no longer available as a location while configuring a test run in your project.

What to do next

You might have to add a remote Docker host to your project to use the remote Docker host as a location to run tests.

Editing configurations of a remote Docker host on page 157

Unregistering a remote Docker host from IBM® Rational® Test Automation Server

You can unregister a remote Docker host that is registered with Rational® Test Automation Server when you no longer require it.

Before you begin

You must have completed the following tasks:

- 1. Set up the remote Docker host computer. See Setting up a remote Docker host computer on page 147 or Setting up a secure remote Docker host computer on page 149.
- 2. Registered the remote Docker host with Rational® Test Automation Server. See Registering a remote Docker host with IBM Rational Test Automation Server on page 153.
- 1. Log in to Rational® Test Automation Server.
- 2. Click Infrastructure > Agents and Intercepts in the navigation pane.

The Agents and Intercepts page is displayed.

You can view the agents, intercepts or Dockers that are registered with Rational® Test Automation Server.

3. Identify the Docker host that you want to unregister.

Note: The and iii icons are displayed in the **Actions** column in the row of the Docker only if you own the remote Docker host.

- 4. Unregister the Docker host by completing the following steps:
 - a. Click the Unregister docker host icon
 - b. Click **Unregister** in the **Unregister docker host** dialog box.

A message is displayed that the Docker host is unregistered successfully.

Results

You have unregistered the remote Docker host from Rational® Test Automation Server. You cannot run tests on this remote Docker host if it is added to your project. You might have to register it again with Rational® Test Automation Server, if you want to use the remote Docker host in your projects.

Test run configurations

You can configure and run tests in IBM® Rational® Test Automation Server after you add the test resources to your project.

Before you configure a test run, you must have completed the following tasks:

- Created a project on Rational® Test Automation Server or you must have been granted access to a project with the *Tester* role assigned. See Test assets and a server project on page 361.
- Created tests in the desktop clients and committed the test assets and test resources to a remote repository. You must have added the remote repository to the project.
- Read the considerations you must take into account for certain test types. See Prerequisites to running tests on page 133.

You must be a project Owner or a member with the Tester role assigned to configure and run a test.

You can find information about how to configure and run the following types of tests:

Configuring a test for a quick run

You can configure any type of test to be run on IBM® Rational® Test Automation Server when you want to quickly ensure that the test runs correctly. You might not want to set the different options for the test nor want to schedule the run.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- Read and completed the tasks mentioned in Prerequisites to running tests on page 133, if they apply to the test that you want to configure for a run.

- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

- 3. Identify and select the test asset or resource that you want to run from the test assets listed.
- 4. Click the **Execute** icon **()** in the row of the identified test asset.

The **Execute test asset** dialog box is displayed.

- 5. Select the version of the test resources that you want to run, if you want to run a different version other than the latest version.
- 6. Select **Now** to initiate the test run immediately after you click **Execute**.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page.

8. Click Execute.

The test run is initiated.

Results

You have started a test run.

What to do next

You can choose to perform any of the following tasks:

- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Related information

Monitoring a test run

Stopping a test run on page 223

Canceling a scheduled test run on page 225

Configuring an AFT Suite run

After you added the test resources that you created in the desktop client to the project, you can configure an AFT Suite to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- You must have read Test run considerations for AFT Suites on page 133, if you want to configure a run for an AFT Suite that has the agent location configured in the AFT XML file.
- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.
 - All test assets in the selected branch are displayed on the **Execution** page.
- 3. Identify the test asset or resource that you want to run by performing any of the following steps:
 - a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
<u>8</u> •• ⊕	Compound Test
	Rate Schedule
0	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon ==.
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon **()** in the row of the identified test asset.

The **Execute test asset** dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- · Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the sticon.
- 6. Select the time for scheduling the test run from the following options:
 - Select Now to initiate the test run immediately after you click Execute.

Important: Click Execute only after you have configured the other settings in this dialog box.

 Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the Label field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

If you are running an AFT Suite and the following conditions are true, then you must perform the next step:

- \circ You do not want to run the test on the agent configured in the AFT XML file.
- You have not selected the agent from the **Override** column in the **Location** tab.
- 8. Click **Advanced** to make the following advanced configurations:
 - a. Add the following setting in the **Program Arguments** field:

```
-swaplocation <configured_agent_location>:<overriding_agent_location>
```

For example, if the configured agent location is *91.2.352.24* and the remote agent where you want to run the test is *100.35.117.164*, then the entry in the **Program Arguments** field is as follows:

-swaplocation 91.2.352.24:100.35.117.164

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.

If	Then
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the **DATA SOURCES** tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 10. Follow the instructions if the test requires a variable that must be passed to the test at the test run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:
 - To add new variables manually, click the **Add Variable** icon ①, enter the name, and value of the variable.
 - To add new variables from your local computer or from the Git repository that is associated
 with your server project, click the Upload icon
 and select the Upload from local system or
 Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if you are running a test that has static agents configured:
 - a. Click the **LOCATION** tab, if it is not already open.

The static agents that are configured in the test asset are listed under the **Host** column. The information about the availability of the agent is displayed.

Note: You must have added agents to your project from the **Infrastructure** page for the agents to be displayed under the **Override** column.

b. Select the agent where you want to run the test asset.

You can select the same agent that is configured in the test asset. Alternatively, you can override the agent with any other agent added to the project by selecting it from the list in the **Override** column.

The default value for the agents is null or an empty field if no agents were configured in the test asset. If the test asset contains agents that are configured, then the default agent is the first item to be displayed on the list of agents listed in the increasing alphabetical order.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 12. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click Execute.

13. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of an AFT Suite.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the **Execution** page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the Execution page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the **Progress** page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Test run configurations on page 162

Configuring an API Suite run

After you added the test resources that you created in the desktop client to the project, you can configure an API Suite to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- You must have completed the following tasks if you are running API Suites that use a transport and the transport requires third-party application Jar files for a successful run:
 - Read Test run considerations for API Suites on page 134.
 - Copied the third-party application Jar files to the third-party application folder on the computer where Rational® Test Automation Server is installed, if you are running the API Suite in Kubernetes. See
 Copying third-party application Jars to Kubernetes on page 73.
 - Copied the third-party application Jar files to the third-party application folder on the computer where
 the remote Docker host is installed, if you are running the API Suite in a remote Docker host. See
 Copying third-party application Jars to a remote Docker host on page 151.

- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

- 3. Identify the test asset or resource that you want to run by performing any of the following steps:
 - a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
高 40 ① ®	Compound Test
	Rate Schedule
9	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

v. Save the filter query by performing the following steps, if you want to reuse the filter query later:

- 1. Click Save.
- 2. Enter a name for the filter query.
- 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon =
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon in the row of the identified test asset.

The **Execute test asset** dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

• Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- · Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the sicon.
- 6. Select the time for scheduling the test run from the following options:
 - Select Now to initiate the test run immediately after you click Execute.
 - Important: Click Execute only after you have configured the other settings in this dialog box.
 - Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

Notes:

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking **Reset**.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the Label field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

8. Click **Advanced** to make the following advanced configurations:

a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the **Environment**Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 9. Follow the instructions if the API Suite has an environment or secrets configured:
 - a. Click the ENVIRONMENT tab, if it is not already open.
 - b. Select the API test environment from the list if there are multiple environments configured in the test asset.
 - c. Select the secrets collection that contains the secrets to be used for the test run.

- The test asset that was created in the desktop client and added to the Git repository must have the environments defined as part of the API test project.
- If the test asset contained secrets, then you must create those secrets in secrets collections in the project.

The default value for the environment is the environment configured in the test asset. The default value for secrets is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 10. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the DATA SOURCES tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if the test requires a variable that must be passed to the test at the test run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:
 - To add new variables manually, click the **Add Variable** icon ①, enter the name, and value of the variable.
 - To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon
 and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 12. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click **Execute**.

13. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of an API Suite.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the Execution page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the **Execution** page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Test run configurations on page 162

Configuring a run of a Compound Test that contains HTML tests

After you added the test resources that you created in the desktop client to the project, you can configure a Compound Test that contains HTML tests to be run on IBM® Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Been assigned the Owner or Tester role in the project to configure and run tests.
- Authored a Compound Test in IBM® Rational® Functional Tester and must have completed the following tasks when you created the test assets:
 - Created a Compound Test under a Web UI project in your workspace.
 - Created a Functional HTML Test under a Compound Test in a Functional test project in the same workspace that contained the Web UI project.
 - Used the startBrowser(Firefox,<URL>) attribute with the browser value set to Firefox in the Functional test script.

Restriction: Functional test scripts that contain the **startApp()** or **callScript()** attributes are treated as non-HTML scripts and are not supported to be used in test scripts in the HTML tests.

- Ran the Compound Test that contains the HTML tests on IBM® Rational® Functional Tester.
- Committed the projects that include the Web UI project (with the Compound Test) and the Functional test (with the HTML tests in a Compound Test) to the remote repository.
- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

- 3. Identify the test asset or resource that you want to run by performing any of the following steps:
 - a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43	API Suite
高 中 切 (8)	Compound Test
91	Rate Schedule

Icon	Represents the test asset or resource
O _I	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon ==.
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon **()** in the row of the identified test asset.

The **Execute test asset** dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

· Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- · Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the sticon.
- 6. Select the time for scheduling the test run from the following options:
 - Select **Now** to initiate the test run immediately after you click **Execute**.

Important: Click Execute only after you have configured the other settings in this dialog box.

 Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking **Reset**.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the Label field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 8. Click Advanced to make the following advanced configurations:
 - a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.

If	Then
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the **Environment**Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the DATA SOURCES tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

c. Select the dataset that you want to use in the test run from any of the following options:

 Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

10. Follow the instructions in this step if the test requires a variable that must be passed to the test at the test run time.

You must configure the supported browser by using a variable if the test has a browser configured, which is different from the one that is supported by Rational® Test Automation Server.

- a. Click the VARIABLES tab, if it is not already open.
- b. Choose one of the following methods to add the variables:
 - To add new variables manually, click the Add Variable icon enter the name, and value of the variable.
 - i. Enter RTW_WebUI_Browser_Selection as the name.
 - ii. Enter Firefox as the value, if you want to use Firefox as the browser and override the browser that is specified in the HTML test.

To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click Execute.

12. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of a Compound Test that contains traditional HTML tests.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the **Execution** page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the Execution page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the **Progress** page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Configuring a run of a Compound Test that contains Web UI tests

After you added the test resources that you created in the desktop client to the project, you can configure a Compound Test that contains Web UI tests to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- Read and completed the tasks mentioned in Prerequisites to running tests on page 133, if they apply to the
 test that you want to configure for a run.
- · You must have completed the following tasks:
 - Created Web UI tests in Rational® Functional Tester and added the test asset to the project repository on IBM® Rational® Test Automation Server.
 - Read about the considerations that you must take into account before you configure a test run to run
 on a remote agent. See Test run considerations for running tests on remote agents on page 140.
- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

3. Identify the test asset or resource that you want to run by performing any of the following steps:

a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
<u>å</u> ⊕	Compound Test
	Rate Schedule
0	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon ==.
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon in the row of the identified test asset.

The Execute test asset dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

• Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

• Expand the list in the **Version** field, and then search for the version that you want to select by entering a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the sicon.
- 6. Select the time for scheduling the test run from the following options:
 - Select **Now** to initiate the test run immediately after you click **Execute**.
 - Important: Click Execute only after you have configured the other settings in this dialog box.
 - Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

Notes:

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the **Label** field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

8. Click **Advanced** to make the following advanced configurations:

a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the **Environment**Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the DATA SOURCES tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 10. Follow the instructions if the test requires a variable that must be passed to the test at the test run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:

- To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon
 and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if you are running a compound test that has static agents configured:
 - a. Click the **LOCATION** tab, if it is not already open.

The static agents that are configured in the test asset are listed under the **Host** column. The information about the availability and capabilities of the agent are displayed.

Note: You must have added agents to your project from the **Infrastructure** page for the agents to be displayed under the **Override** column.

b. Select the agent where you want to run the test asset in the following scenarios:

If	Then	Action
The agent specified in the test assets is available and no other agents are added to the project.	There is no agent displayed for override.	Select the agent in the Host column as the location to run the test.
The agent specified in the test assets is available and there are other agents that are added to the project.	Agents that have capabilities that match with the agent capabilities specified in the test assets are filtered and displayed in the Override column. An agent from among the agents with matching capabilities is automatically selected for an override. Note: The agents that	Perform any of the following actions: • Select the agent in the Host column as the location to run the test. • Select an agent in the Override column as the location to run the test.
	have the capabilities that are missing from	

If	Then	Action
	the agent in the Host column are displayed with the licon.	
The agent specified in the test assets is not available and there are other agents that are added to the project.	Agents that have capabilities that match with the agent capabilities specified in the test assets are automatically selected for an override in the Override column.	Select an agent in the Override column as the location to run the test.
	If there are no agents with any capabilities that match with the agent capabilities specified in the test assets, no agent is selected or displayed for an override in the in the Override column.	You cannot run the test.

The default value for the agents is null or an empty field if no agents were configured in the test asset. If the test asset contains agents that are configured, then the default agent is the first item to be displayed on the list of agents listed in the increasing alphabetical order.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 12. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click **Execute**.

13. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of a Compound Test that contains Web UI tests.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the Execution page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the **Execution** page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the **Progress** page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Configuring a run of a Compound Test that contains mobile tests

Disclaimer: This release contains access to run mobile tests on IBM® Rational® Test Automation Server as a Tech Preview. The Tech Preview is intended for you to view the capabilities offered by Rational® Test Automation Server, and to provide your feedback to the product team. You are permitted to use the information only for evaluation purposes and not for use in a production environment. IBM provides the information without obligation of support and "as is" without warranty of any kind.

After you added the test resources that you created in the desktop client to the project, you can configure a Compound Test that contains mobile tests to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- You must have created the mobile tests in Rational® Functional Tester and added the test asset to the project repository on IBM® Rational® Test Automation Server.
- You must have created a variable file if you want to import the variables file. The file must contain the details
 of the Appium server that is connected to the remote agent or the device cloud to which the mobile device is
 connected.
- Read Considerations for using Jaeger traces in reports on page 139, if you want to configure a run and you
 want Jaeger to report the test results for the test.

About this task

You can run the mobile tests that are contained in a Compound Test after you create the tests in Rational® Functional Tester, and then add them to your project on IBM® Rational® Test Automation Server. You can then run the mobile tests on the mobile devices that are connected to any of the following agents or clouds:

- · Remote agents on which the Appium server is installed.
- · The BitBar Cloud.
- The Perfecto Mobile cloud.

You must provide the details of the server or the mobile cloud to which the mobile devices are connected as variables in Step 10 on page 202. You can either enter the variables or use the file in which you entered the variables. You must refer to the following tables for the variables that are required for a successful run:

Table 5. Variables for the Appium server

Name of the Variable	Action for the Value field
Mobile_Device_Selection	Specify the name of the mobile device that is connected to the Appium server.

Table 5. Variables for the Appium server (continued)

Name of the Variable	Action for the Value field
appium.server.host	Specify the host name or IP address of the Appium server.
appium.server.port	Specify the port on the Appium server that is configured to communicate with Rational® Test Automation Server.

Table 6. Variables for the BitBar cloud

Name of the Variable	Value
Mobile_Device_Selection	Specify the name of the mobile device that is connected to the BitBar Cloud.
bitbar.apikey	Specify the user token generated for your BitBar account to authenticate your connection with the BitBar Cloud.
bitbar.host	Specify the host name of the BitBar Cloud instance.
bitbar.project	Specify the name of the project that contains the recorded test.
bitbar.testrun	Specify a name for the test run that must be displayed in the BitBar dashboard for the test run.

Table 7. Variables for the Perfecto mobile cloud

Name of the Variable	Value
Mobile_Device_Selection	Specify the name of the mobile device that is connected to the Perfecto Mobile cloud.
perfecto.securitytoken	Specify the user token generated for your Perfecto account to authenticate your connection with the Perfecto Mobile cloud.

Table 7. Variables for the Perfecto mobile cloud (continued)

Name of the Variable	Value
perfecto.host	Specify the host name of the Perfecto Mobile cloud in-
	stance.

- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

- 3. Identify the test asset or resource that you want to run by performing any of the following steps:
 - a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
高4 ① 8	Compound Test
	Rate Schedule
0	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path

- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon ==.
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon in the row of the identified test asset.

The **Execute test asset** dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the x icon.
- 6. Select the time for scheduling the test run from the following options:
 - Select Now to initiate the test run immediately after you click Execute.

Important: Click Execute only after you have configured the other settings in this dialog box.

 Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

Notes:

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the Label field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 8. Click **Advanced** to make the following advanced configurations:
 - a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the **Environment**Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the DATA SOURCES tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 10. Perform the following steps to provide the variables that specify the server or cloud to which the mobile device is attached. You can either enter the variables that must be passed to the test at the test run time or import the file that contains the variables.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:
 - To add new variables manually, click the **Add Variable** icon , enter the name, and value of the variable.
 - To add new variables from your local computer or from the Git repository that is associated
 with your server project, click the Upload icon
 and select the Upload from local system or
 Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

11. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of a Compound Test that contains mobile tests.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the **Execution** page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the Execution page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the Progress page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the Progress page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Test run configurations on page 162

Configuring a run of a Compound Test that contains performance tests

After you added the test resources that you created in the desktop client to the project, you can configure a Compound Test that contains performance tests to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

- 3. Identify the test asset or resource that you want to run by performing any of the following steps:
 - a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
<u>8</u> •• ⟨⊕	Compound Test
	Rate Schedule
e _i	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:

- i. Click New filter.
- ii. Select an operator, and add a rule, or a group of rules.
- iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon =
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon **()** in the row of the identified test asset.

The Execute test asset dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

• Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- Commit message.
- Tags labeled by the user for the version committed.

- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the ** icon.
- 6. Select the time for scheduling the test run from the following options:
 - Select Now to initiate the test run immediately after you click Execute.

Important: Click Execute only after you have configured the other settings in this dialog box.

 Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is **Now**.

Notes:

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the **Label** field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 8. Click **Advanced** to make the following advanced configurations:
 - a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the Environment
 Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the **DATA SOURCES** tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

• Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 10. Follow the instructions if the test requires a variable that must be passed to the test at the test run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:
 - To add new variables manually, click the **Add Variable** icon ①, enter the name, and value of the variable.
 - To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon
 and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if you are running a test that has static agents configured:
 - a. Click the **LOCATION** tab, if it is not already open.

The static agents that are configured in the test asset are listed under the **Host** column. The information about the availability of the agent is displayed.

Note: You must have added agents to your project from the **Infrastructure** page for the agents to be displayed under the **Override** column.

b. Select the agent where you want to run the test asset.

You can select the same agent that is configured in the test asset. Alternatively, you can override the agent with any other agent added to the project by selecting it from the list in the **Override** column.

The default value for the agents is null or an empty field if no agents were configured in the test asset. If the test asset contains agents that are configured, then the default agent is the first item to be displayed on the list of agents listed in the increasing alphabetical order.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 12. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click Execute.

13. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of a Compound Test that contains performance tests.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the **Execution** page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the Execution page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the **Progress** page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Test run configurations on page 162

Configuring a run of a Rate Schedule or VU Schedule

After you added the test resources that you created in the desktop client to the project, you can configure a Rate Schedule or VU Schedule to be run on IBM® Rational® Test Automation Server.

Before you begin

- Ensured that you are assigned a role as a *Project Owner* or *Tester* in the project. See Managing access to server projects on page 369.
- Read Test run considerations for schedules on page 138, if you want to configure a run for Rate Schedules
 or VU Schedules that have Resource Monitoring sources configured.
- 1. Open the project that contains the test assets or resources that you added from the Git repository, and then click **Execution**.
- 2. Select the branch of the repository that contains the test assets or resources that you want to run.

All test assets in the selected branch are displayed on the **Execution** page.

3. Identify the test asset or resource that you want to run by performing any of the following steps:

a. Identify the test asset or resource by scrolling through the list.

Note: You can also identify the type of the asset from the icon that represents the test type as shown in the following table:

Icon	Represents the test asset or resource
•	AFT Suite
43-	API Suite
<u>å</u> ⊕	Compound Test
	Rate Schedule
0	VU Schedule

- b. Search for the test asset or resource by entering any text contained in the test asset or resource name in the **Search** text box.
- c. Create a filter query by using the **New filter** option by performing the following steps:
 - i. Click New filter.
 - ii. Select an operator, and add a rule, or a group of rules.
 - iii. Add or enter the relevant parameters and either select or enter the condition and the criteria for the condition.

You can select a parameter from the following list:

- Type
- Test Asset Name
- Test Asset Path
- Last Result
- Next Run
- iv. Apply the filter query to filter the assets based on the query.

The test assets that match the filter criteria are displayed.

- v. Save the filter query by performing the following steps, if you want to reuse the filter query later:
 - 1. Click Save.
 - 2. Enter a name for the filter query.
 - 3. Click Save.
- d. Retrieve a saved filter, if you have saved filter queries earlier by performing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- i. Click the Open filters icon =
- ii. Select the saved filter in the Filters dialog box.
- iii. Click Apply to apply the filter.

The test assets that match the filter criteria are displayed.

4. Click the **Execute** icon in the row of the identified test asset.

The Execute test asset dialog box is displayed.

5. Select the version of the test resources that you want to run by completing any of the following actions:

Note: The test resources in the version can contain the test assets, datasets, AFT XML files, API environment tags, and other resources specific to projects created from any of the desktop clients.

• Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- Commit message.
- Tags labeled by the user for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version that is committed, and then followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

The default value for the version selected for the run is the latest version in the selected branch in the repository. If you do not select any version, then the latest version is selected for the test run.

Notes:

- If you selected a version but you do not want to use that version in the test run, you can remove the selected version by clicking the x icon, then the default version is selected for the test run.
- If you repeated a test or ran the test again from the **Results** page, then the version of the test resources that you had selected for the earlier run is shown as selected. You can either retain this version or select any other version from the list. You can also remove the previous version by clicking the sicon.
- 6. Select the time for scheduling the test run from the following options:
 - Select **Now** to initiate the test run immediately after you click **Execute**.
 - Important: Click Execute only after you have configured the other settings in this dialog box.
 - Select Later and configure the date and time for scheduling a test to run at the scheduled date and time.

The default time for scheduling a run is Now.

Notes:

- If you have configured some or all of the settings for the current test run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a test run and do not want to use the saved settings from a previous run,
 you can reset all the saved settings to their default values by clicking Reset.
- 7. Enter a label for the test run that helps you to identify the test on the **Results** page.

After the test run completes, the label that you entered is displayed for the test under the **Labels** column on the **Results** page. After you have created a label, any member of the project can use that label.

The default value for the **Label** field is null or an empty field.

Important: The configuration that you set for the test run in the **Execute test asset** dialog box is preserved when you run the same test again. Those changes are not visible when another user logs in to Rational® Test Automation Server. For example, if you created new variables on the server, those variables are available only for you when the same test is run again.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

8. Click **Advanced** to make the following advanced configurations:

a. Enter any JVM arguments that must be passed to the test run at run time in the **JVM Arguments** field, if applicable for the test.

For example, you can set a maximum Java heap size.

b. Enter program arguments that must be passed to the test run at run time in the **Program Arguments**, if applicable for the test.

If the test that you want to configure supports Jaeger tracing, then do the required tasks in the following scenarios:

If	Then
You want to obtain the test results as a Jaeger trace.	Enter -history jaeger in the Program Arguments field.
Jaeger is already set as a program argument and you want to remove the Jaeger trace for your test.	Delete the -history jaeger entry in the Program Arguments field.
You want the report as a test log and as a Jaeger trace.	Enter -history jaeger, testlog in the Program Arguments field.

Note: The default report format is the *test log* format for the test reports.

c. Enter the environment variables that must be passed to the test run at run time in the **Environment**Variables field, if applicable for the test.

For example, enter the environment variables when the third-party libraries that are used in the test run refer to the environment variables for configuration.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for each of the fields for the advanced settings is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 9. Follow the instructions if you are running a test asset that contains datasets:
 - a. Click the DATA SOURCES tab, if it is not already open.
 - b. Consider the following information about datasets before you select a dataset:

The default value for the datasets in the **DATA SOURCES** tab is null if the test asset did not have an associated dataset. If the asset had an associated dataset, the default value is the associated dataset.

You can utilize the dataset stored as an Excel or CSV file to override the original dataset associated with the Suite, test, or schedule. For example, when you have associated a dataset in .xlsx, .xls, or .csv format with the test or schedule in desktop clients and if you have another set of data stored in an Excel or CSV file, then you can select that dataset from the **Override** list.

Remember: You must have uploaded the dataset as an Excel or CSV file into the Git repository, and ensured that both the original dataset (from the test asset) and new datasets (added to the project) have the same column names.

- c. Select the dataset that you want to use in the test run from any of the following options:
 - Select the dataset that is displayed as the default dataset when the test asset contains a single dataset.

Note: If there is only one dataset in the test asset, then that dataset is displayed as the default dataset.

· Select the dataset from the list.

Note: If there are multiple datasets in the test asset, the datasets are listed in their increasing alphabetical order.

 Select the dataset from the Override list to override the dataset that was associated with the test in the desktop client.

Important: If the test contains an encrypted dataset, the Project Owner must classify it in the **DATA SECURITY** tab on the Project page before you can select it. You must have added datasets to your project from the **Dataset** page for the datasets to be displayed in the **Override** list.

If you want to run the test immediately or at the scheduled time, click **Execute**, or continue with the next step.

- 10. Follow the instructions if the test requires a variable that must be passed to the test at the test run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:

- To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon
 and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

The default value for the variables is null or an empty field.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 11. Follow the instructions if you are running a test that has static agents configured:
 - a. Click the **LOCATION** tab, if it is not already open.

The static agents that are configured in the test asset are listed under the **Host** column. The information about the availability of the agent is displayed.

Note: You must have added agents to your project from the **Infrastructure** page for the agents to be displayed under the **Override** column.

b. Select the agent where you want to run the test asset.

You can select the same agent that is configured in the test asset. Alternatively, you can override the agent with any other agent added to the project by selecting it from the list in the **Override** column.

The default value for the agents is null or an empty field if no agents were configured in the test asset. If the test asset contains agents that are configured, then the default agent is the first item to be displayed on the list of agents listed in the increasing alphabetical order.

If you want to run the test immediately or at the scheduled time, click Execute, or continue with the next step.

- 12. Follow the instructions if you want to change the location for running the test:
 - a. Click the **LOCATION** tab, if it is not already open.

The **Default Cluster** is the default location where the test runs, and it is listed under the **Host** column. The information about the availability of the default location is displayed.

Important: You must have added remote Docker hosts that are registered with Rational® Test Automation Server to your project from the **Infrastructure** page. The remote Docker hosts are then displayed under the **Override** column.

Notes:

- If remote Docker hosts are not added to your project, the option No override options is displayed as the default value and the test runs in the Kubernetes cluster of Rational® Test Automation Server.
- If remote Docker hosts are added to your project, the added Docker hosts are displayed along with their availability status and ownership information.
- b. Select the location where you want to run the test asset from the following options:
 - Select the **Default Cluster** when no remote Docker hosts are available in your project.
 - Select the remote Docker host from the list when a remote Docker host is available in your project.
 - Select No override options, if you selected any remote Docker host and want to revert to the Default Cluster to run the test asset.

If you want to run the test immediately or at the scheduled time, click Execute.

- 13. Follow the instructions if you want to override the Resource Monitoring labels in the test asset with the Resource Monitoring labels that you created in Rational® Test Automation Server:
 - a. Click the Resource Monitoring tab.

Note:

The **Resource Monitoring** tab displays only if you enabled the **Resource Monitoring from Service** option in Rational® Performance Tester when you created the test asset.

b. Click the list. b. Click the ctrl + space bar keys, or enter the initial letter of a label to select a label in the list.

Note:

You can select or add labels only if you added the labels in the **Resource Monitoring Sources** page in Rational® Test Automation Server.

14. Click Execute.

The test run is initiated.

Results

You have configured and either started or scheduled a test run of a Rate Schedule or VU Schedule.

What to do next

You can choose to perform any of the following tasks after you have initiated or scheduled a run:

- Stop the test run at any point after the test run is initiated, from the **Execution** page. See Stopping a test run on page 223.
- Cancel a scheduled test run, from the Execution page. See Canceling a scheduled test run on page 225.
- View the progress of the test from the **Progress** page. See Viewing the progress of running test assets on page 218.
- Monitor the test from the **Progress** page. See Monitoring a test run.
- View the results, reports, and logs of the test from the **Results** page after the test completes the run. See Test results on page 267.

Test run configurations on page 162

Management of running tests

Find information about the tasks that you can perform on a test that you configured for a run either while it runs or after it completes the run.

Viewing the progress of running test assets

After you initiate or schedule a test run on the **Execution** page, you can view the progress of the test assets that are running or scheduled to run, from the **Progress** page. You can also view the test assets that have completed their run, are stopped or canceled, during the past hour.

Before you begin

You must have initiated runs of the test assets in your project from the **Execution** page.

1. Open your project and click **Progress**.

Any one of the following views is displayed:

- No test assets are displayed in the **Progress** page if there are no test assets that are running, scheduled to run, or have completed their run in the past hour.
- Test assets in your project that are in any of the following states are listed:

- Running
- Scheduled
- Completed
- Stopped
- Canceled
- No test assets are displayed but the options Hide inactive and Show all are present. Click Show all
 to display all the test assets on the Progress page. Test assets that were hidden from the display are
 displayed.

Note: Test assets are automatically removed from the display after 60 minutes of being added to the **Progress** page. Therefore, you can only view the test assets that were added to the **Progress** page in the past hour. You cannot use the **Progress** page to view the history of test assets that were run from the **Execution** page.

- 2. Identify the test asset for which you want to view the progress from the test assets listed. You can also identify the test asset by completing any of the following actions:
 - · Search for the test asset by entering any text contained in the test asset name in the Search text box.
 - Sort the test assets by the user who started the test by clicking the Started by column header, and find the test asset listed against your name.
 - Sort the test assets by the type of the test assets by clicking the Started by column header, and find
 the test asset type you ran or scheduled.
 - Click Hide inactive to only display the test assets that are running or scheduled to run. This action removes all completed, canceled, stopped, or failed test assets from the display.

You can view the following details of your test asset on the Progress page:

Column head- er	Description
Туре	Displays the icon for the type of the test asset.
Name	Displays the name of the test asset added to the project from the Git repository.
Started by	Displays the name of the user who started the run of the test asset.
Start Time	Displays the start time of the test asset run.
End Time	Displays the end time of the test asset run.
Status	Displays the state of the test asset progressively.

Column head- er	Description
	For example, after the run is in the Initiated state, it moves on to the Running state and ends in its final state depending on the verdict of the test run as either Completed, Failed, Or Inconclusive.
	If the test run is stopped or a scheduled run is canceled, the status displayed is stopped by User for a stopped run or Canceled for a canceled test.

From the Actions column, you can perform the following operations on your test asset:

- Stop a run.
- Cancel a scheduled run.
- Monitor a VU Schedule, Rate Schedule, Compound Test, or an AFT Suite.
- · View the execution log.
- View the result of the test asset on the **Results** page.

Results

You have viewed the progress of the test assets that you ran from the **Execution** page.

What to do next

You can choose to perform any of the following tasks from the **Progress** page:

- · Stop a test asset that is running.
- Cancel a scheduled run.
- Monitor tests (such as the Schedules, Compound Test, and AFT Suites).
- View the results or the execution log of the test asset from the **Actions** column by clicking the **Open action** menu icon ...
- View the results, reports, and logs of the completed test run from the **Results** page.

Canceling a scheduled test run on page 225

Stopping a test run on page 223

Checking logs

To verify how the test ran or to debug test run failure, you can check the Test Log and Execution log.

About this task

The Test Log displays the interaction between Rational® Test Automation Server and the application or system under test. After the test run completes, the verdict of the run can be *Pass*, *Fail*, or *Inconclusive*. If the verdict of the run is Pass, the Test Log is available in the **Results** page.

The Execution log displays the console messages of the run time process that runs the test. This log is useful in determining the cause of the failure if the verdict of the run is *Fail* or *Inconclusive*. You can view the Execution log from the **Progress** page.

Viewing the Test Log

- 1. Go to the **Results** page and identify the test that you ran.
- 2. Click the test so that the **Reports** panel is displayed.
- 3. Click the **Test Log** in the **Reports** panel.

The Test Log is displayed in a browser window.

Viewing the Execution log

- 4. Go to the **Progress** page and identify the test that is in the *Running* state.
- 5. Click the Open action menu icon.
- 6. Click Execution log.

The Execution log is displayed in a browser window.

Monitoring a test run

Resetting the configuration settings for a test run

When you are configuring a test run either as a first-run or when repeating the run, and you do not want to proceed with the settings configured or saved for the test run, you can reset the configuration settings. Resetting the configuration reverts all the settings to their default values for the test run.

Before you begin

You must be a member of the project with the Owner or Tester role to run the tests.

You must ensure that you have the **Execute test asset** dialog box is displayed before you proceed with resetting the configuration settings for the test run.

About this task

You can reset the configuration settings when you are configuring a test run either for its first run or when you are repeating the test run.

1. Click **Reset** in the **Execute test asset** dialog box at any point when you want to reset the configuration settings for the test run.

- If you have configured some or all of the settings for the current test run and you do not want to continue with those settings, clicking Reset resets the settings to their default values.
- If you are repeating a test run and do not want to use the saved settings from a previous run,
 clicking Reset reverts all the saved settings to their default values.

The settings in the **Execute test asset** dialog box are reset to their default values.

2. Use the following table to find the default values for each of the settings in the **Execute test asset** dialog box:

Window or Tab	Field or Setting	Default value is
Execute test asset	Scheduling the test run	Now is selected.
Execute test asset	Label for settings	Null or empty field.
Advanced	JVM Arguments	Null or empty field.
	Program Arguments	Null or empty field.
	Environment Variables	Null or empty field.
ENVIRONMENT tab	API test environment	The environment configured in the test asset.
	Secrets collection	Null or empty field.
DATA SOURCES tab	Override list	Null or empty field if the asset has no dataset.

Window or Tab	Field or Setting	Default value is
		The dataset in the test asset if the asset has one dataset.
		The first dataset on the list of datasets, which are listed in the increasing alphabetical order, if the asset has multiple datasets.
VARIABLES tab		Null or empty field.
LOCATION tab	Agents	Null or empty field if the asset has no agents configured.
		The first agent on the list of agents, which are listed in the increasing alphabetical order, if the asset has multiple agents configured.
	Docker host	Internal Docker host if no remote Docker hosts are added.
		No override options if other Docker hosts are saved in previous runs.

What to do next

You can complete configuring the settings that you want for the test run. See Test run configurations on page 162.

Stopping a test run

You might want to stop a test run when you realized that you did not configure all the settings or you want to change a few settings for the test run.

Before you begin

You must have initiated a test run from the **Execution** page.

About this task

You can stop a running test from the Progress page by using the **Stop execution** icon \otimes . You cannot stop the test run if the test has already completed its run.

1. Go to the **Progress** page and identify the test that you want to stop.

Note: You can stop a running test if it is in the In Transition Or Running state.

2. Click the **Stop execution** icon in the **Actions** column of the selected test. **Result**

The Stop execution dialog box is displayed.

3. Set the timeout period for stopping the test run. Enter a numeric value and select the unit from the options available as Seconds, Minutes, or Hours.

The time out period is the time during which the test run is allowed to stop on its own and after the timeout period, the test is forced to stop abruptly.

Important: If the timeout period is not set, the default of *30 seconds* is considered as the default timeout period.

4. Keep the option **Capture results** selected, if you want the results to be captured for the test. The captured results for the test are available to view from the Results page. Clear this option if you do not want to capture the results.

Note: The option Capture results is selected by default.

Important: The results are always captured for API suites even if you clear the Capture results option.

5. Keep the option **Execute 'finally-block'**, **if present** selected, if you want the *finally-block* code in the test script, if present, to be run before the test run is stopped. Clear this option if you do not want to run the *finally-block* code in the test script.

Note: The option Execute 'finally-block', if present is selected by default.

Restriction: The *tear-down* steps equivalent to the 'finally-block' code, if present in API suites are not controllable at runtime. The **Execute 'finally-block'**, if present option has no impact on API suites.

6. Click Stop execution.

A notification message is displayed that the test run is stopped successfully.

Note: If the test run completes before you can configure the options for stopping the test run, a notification is displayed in the **Stop execution** dialog box that the test asset has completed its run.

Results

You have successfully stopped a running test. The stopped test runs are displayed on the Progress page with the status as *Stopped by User*. Stopped tests are not considered in the count of tests executed that are displayed on the Overview page.

What to do next

You can re-initiate the test run from the Execution page by completing the configurations that you want for the test.

You can see the results or the execution log of the stopped test from the **Actions** column on the Progress page by clicking the **Open action menu** icon .

Canceling a scheduled test run on page 225

Canceling a scheduled test run

You might want to cancel a scheduled test run when you realized that you did not configure all the settings for a test, want to change a few settings for the test, or do not want that test to run.

Before you begin

You must have scheduled a test run from the Execution page.

About this task

You can cancel a scheduled test by using the Cancel icon 8 available on the Progress page.

- 1. Go to the **Progress** page and identify the scheduled test that you want to cancel.
- 2. Click the Cancel icon (8) in the Actions column of the selected test.

Result

The **Cancel scheduled execution** dialog box is displayed.

3. Click Yes.

Result

A notification is displayed that the scheduled test run is canceled.

Results

You have successfully canceled a scheduled test. The canceled test runs are displayed on the **Progress** page with the status as *Canceled*. The canceled test runs are not displayed on the **Results** page and are not considered in the count of tests executed that are displayed on the **Overview** page.

What to do next

You can re-initiate the test run from the Execution page by completing the configurations that you want for the test.

Management of virtualized services

Disclaimer: This release contains access to the Virtual services that virtualize the Istio based services feature in IBM® Rational® Test Automation Server as a Tech Preview. The Tech Preview is intended for you to view the capabilities for virtualized services offered by Rational® Test Automation Server, and to provide your feedback to the product team. You are permitted to use the information only for evaluation purposes and not for use in a production environment. IBM provides the information without obligation of support and "as is" without warranty of any kind.

You can find information about the tasks that you can perform on and manage the virtualized services that run on Rational® Test Automation Server. You can start or stop the virtual services that are connected to Rational® Test Automation Server. You can view the routing rules and usage statistics of virtualized services, agents, or intercepts that are connected to Rational® Test Automation Server.

You must create stubs or virtual services in Rational® Integration Tester for the following types of services. You must commit the virtual service resources to a remote repository and then add the repository to your project on Rational® Test Automation Server before you can run the virtual services on Rational® Test Automation Server:

- Virtual services that utilize the WebSphere® MQ transport.
- Virtual services that utilize the HTTP transport.
- Virtual services that virtualize the Istio based services. You can run virtual services for the following types of requests received or sent by the Istio service mesh:
 - Requests received by services in the Istio service mesh.
 - Requests sent from namespaces in the Istio service mesh to external services that are not in the Istio service mesh.

Important: You can run virtual services only in the **Default Cluster** location of Rational® Test Automation Server. You cannot run virtual services on a remote Docker host.

Working with virtual services

You can perform the following tasks on virtual services on Rational® Test Automation Server:

- Read about the considerations before you configure a run of the virtual services. See Prerequisites for running virtual services on page 227.
- Read about the considerations before you configure a run of the Istio based services that are virtualized.
 See Prerequisites for running virtualized Istio based services in IBM Rational Test Automation Server on page 229.
- Set up the HTTP proxy, if you have configured stubs in the test assets to use an HTTP proxy to route requests. See Setting up the HTTP proxy on page 230.
- View all intercepts that are registered with Rational® Test Automation Server including those that you have not configured. See Viewing intercepts that are registered with IBM Rational Test Automation Server on page 231.
- View virtual service resources in the test assets that are in the repositories added to a project on Rational®
 Test Automation Server. Viewing virtual service resources on page 232.
- Configure runs of virtual services. See Configuring a run of a virtual service on page 235.
- Configure runs of HTTP virtual services to run without using proxies. See Running HTTP virtual services without using proxies on page 247.
- Run Istio stubs that were created in Rational® Integration Tester to virtualize services in the Kubernetes cluster on which Rational® Test Automation Server is installed.
- View running instances of virtual services. See Viewing running instances of virtual services on page 252.
- View configurations of a running virtual service instance. See Viewing configurations of running instances of virtual services on page 256.
- Modify the configurations of a running virtual service instance. See Modifying configurations of running instances of virtual services on page 260.
- View details of the usage statistics of the virtual services. See Viewing usage statistics of virtual services on page 264.
- View routing rules of the intercepts. See Viewing routing rules of the virtual services on page 262.
- Stop a running virtual service instance. See Stopping a virtual service on page 266.

Prerequisites for running virtual services

You can find information about the prerequisite tasks that you must complete before you configure a run of the virtual services on IBM® Rational® Test Automation Server.

Prerequisites for running HTTP virtual services

You can find information about the tasks that you must complete before you configure a run of the HTTP virtual services on IBM® Rational® Test Automation Server.

Conditions for running of HTTP virtual services

Before you run the HTTP virtual services from Rational® Test Automation Server, you must check for the following conditions and perform the actions indicated:

If	Then
You want to route the HTTP traffic via the HTTP proxy either to the virtual service or live systems, based on routing rules.	You must set up the HTTP proxy. See Setting up the HTTP proxy on page 230.
	HTTP virtual services are exposed via host names are of the following form: in- <unique_id>.<ingress_domain> Note: The DNS used by a computer that runs a client application or the HTTP proxy that routes traffic to the virtual service needs to resolve such host names to the IP address of the ingress domain. You must perform the following actions that depend on the method you have used to set up the ingress domain: • If you used nip.io to form the ingress domain, then that virtual services host names are automatically resolved to the IP address of the ingress domain. For example, if you used nip.io to form the ingress domain as follows: 10.1.2.3.nip.io The virtual services host names are resolved by</ingress_domain></unique_id>
	nip.io to the IP address as 10.1.2.3. • If your ingress domain does not use nip.io then you must ensure that the DNS in use by the client application or the HTTP proxy can resolve host names of the virtual services to the IP address of the ingress domain. For example, if the ingress domain is as follows: myhost.mycom.com The DNS must resolve *.myhost.mycom.com to the IP address of myhost.mycom.com.

Related information

Setting up the HTTP proxy on page 230

Running HTTP virtual services without using proxies on page 247

Prerequisites for running virtualized Istio based services in IBM® Rational® Test Automation Server

You can find information about the tasks that you must complete before you run virtualized Istio based services in Rational® Test Automation Server.

Configuring virtualized Istio based services in Rational® Test Automation Server

When you intend to virtualize services in the Istio mesh in Rational® Test Automation Server, you can create stubs in Rational® Integration Tester.

When you create the Istio stubs in Rational® Integration Tester, you must ensure that you are aware of the fully qualified domain name (FQDN) or the short name of the service that you want to virtualize in the Kubernetes cluster that hosts Rational® Test Automation Server.

The FQDN of the service is as follows:

<service-name>.<namespace>.<svc>.<cluster-name>

The short name of the service is as follows:

<service-name>

For example, if you want to virtualize the HTTP traffic in the service named as *reviews* that runs in a namespace named as *bookinfo*, and in the resource named as *svc* in the Kubernetes cluster named as *mycluster*, then the FQDN of the service is as follows:

reviews.bookinfo.svc.mycluster

The short name of the service is as follows:

reviews

You must enter the host of the service that you want to virtualize, in the **Host** field of the physical transport in Rational® Integration Tester. You can provide either the FQDN or the short name of the service.

Note: The pass-through action in the stubs is not supported.

Considerations for running of stubs that virtualize Istio services

Before you run the stubs that virtualize services in namespaces contained in the Rational® Test Automation Server Kubernetes cluster, you must install Rational® Test Automation Server with the *demo* configuration.

When you install Rational® Test Automation Server by using the *demo* configuration, then Rational® Test Automation Server is preconfigured to use the **bookinfo** namespace as the virtualization namespace.

Note: You can change or add virtualization namespaces by adding the helm installation argument execution.istio.namespaces along with a list of namespaces in a helm command.

After you author the virtualized Istio based services, you must commit the virtual service resources to a repository and add the repository to the project on Rational® Test Automation Server. You can configure a run of the virtualized Istio service. See Configuring a run of a virtual service on page 235.

Installation of the server software on page 25

Setting up the HTTP proxy

When you want to run HTTP virtual services on IBM® Rational® Test Automation Server, you can set up an HTTP proxy to route requests to the virtual service. You must configure the HTTP proxy with the Rational® Test Automation Server URL and offline user token generated from Rational® Test Automation Server so that the HTTP proxy can register with Rational® Test Automation Server.

Before you begin

You must have installed the proxy component from Rational® Test Control Panel of the same version as that of Rational® Test Automation Server.

About this task

You must edit the registration.xml file that is located in the <RTCP_install_directory>\httptcp directory for the following attributes:

- · server base-url
- · security-token

You must enter the Rational® Test Automation Server URL and offline user token as the values for the attributes. After you restart the proxy, the HTTP proxy registers with Rational® Test Automation Server. You can view the registered intercepts from the **Infrastructure > Agents and Intercepts** page.

- 1. Perform the following steps in Rational® Test Automation Server:
 - a. Log in to Rational® Test Automation Server.
 - b. Generate the offline user token.
 - c. Copy the offline user token to a text file.
- 2. Perform the following steps to edit the registration.xml file that is located in the <RTCP_install_directory>\httptcp directory:

- a. Use a text editor to open the registration.xml file.
- b. Enter the Rational® Test Automation Server URL and offline user token generated from Rational® Test Automation Server in the following setting:

```
<server base-url="<Rational® Test Automation Server_URL>" security-
token="<Offline_User_Token>" />
```

Note: If an entry exists, you must either comment out that entry and add a new one or replace the contents.

- c. Save and close the file.
- d. Restart the HTTP proxy.
- 3. Perform the following steps in Rational® Test Automation Server:
 - a. Log in to Rational® Test Automation Server.
 - b. Click Infrastructure > Agents and Intercepts to view the registered intercepts.

The HTTP proxies that you configured with your offline user token are displayed.

Results

You have successfully configured the HTTP proxy and viewed that it is registered with Rational® Test Automation Server.

What to do next

You can perform the following tasks:

- Read for the prerequisite tasks that you must perform before you can run the HTTP stubs. See Prerequisites
 for running HTTP virtual services on page 227.
- Run the virtual service resource. See Configuring a run of a virtual service on page 235.
- View the routing rules for the intercept. See Viewing routing rules of the virtual services on page 262.
- View the routing rules for the intercept in a running instance of the virtual service. See Viewing configurations of running instances of virtual services on page 256.

Viewing intercepts that are registered with IBM® Rational® Test Automation Server

After you install the HTTP proxies and configure them with your offline user token, the proxies register with Rational® Test Automation Server as intercepts and you can view the registered intercepts on the **Agents and Intercepts** page.

Before you begin

You must have completed the following tasks:

- Installed the HTTP proxies of the same version as the version of Rational® Test Automation Server.
- Configured the HTTP proxy with your offline user token so that the proxy can register as an intercept with Rational® Test Automation Server. See Setting up the HTTP proxy on page 230.
- 1. Log in to Rational® Test Automation Server.
- 2. Click Infrastructure > Agents and Intercepts in the navigation pane.

The Agents and Intercepts page is displayed.

You can view the agents, intercepts, or Docker hosts that are registered with Rational® Test Automation Server.

- 3. You can view the intercepts that you own in any of the following ways:
 - Search for the intercept by entering the name of the intercept in the Search field.

Note: You can enter either the full name or any text that is in the name. The search is enabled for case-sensitive text that you can enter.

- Sort the **Type** column to show the items sorted with the intercepts in the rows at the top of the table.
- Sort the Agents column and identify the intercepts by their names or by their owner.

You can view the following details about the intercepts that are registered with Rational® Test Automation Server:

- Any project is displayed in the Projects column indicating that the intercept can be used by virtual services in any project.
- The status of the intercept is displayed in the **Status** column.

Results

You have viewed the registered intercepts from the Agents and Intercepts page.

What to do next

You can start the virtual services that use the registered intercepts. See Configuring a run of a virtual service on page 235.

Viewing virtual service resources

When project repositories contain virtual service resources and you want to view the resources so that you can run them, you can view the virtual services from the **Resources** page in Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Created virtual services that use the HTTP or IBM® WebSphere® MQ transport for tests in HCL OneTest™ API, committed the test resources to the remote repository, and added the repository to your project.
- Been assigned the *Viewer, Tester,* or *Owner* role in the project so that you can view the virtual service resources that are in the project repositories.

About this task

After you have committed the test assets and resources to the remote repositories and added the repositories to projects on Rational® Test Automation Server, you can go to the **Resources** page and perform the following tasks:

- View the virtual service resources that are contained in any branch of the repositories that are added to your project.
- · Create or use saved filters for viewing virtual service resources.
- Run or start an instance of the virtual service resource.
- · View the number of instances of the virtual service resources that are running.
- View all instances of a running virtual service on the **Instances** page by clicking the **Show in instances page** icon .
- 1. Log in to Rational® Test Automation Server.
- 2. Open the project that contains the virtual service resources in the test assets by clicking **Projects > My Projects > project_name**.
- 3. Click Virtualization > Resources in the navigation pane.

The **Resources** page is displayed.

4. Complete the steps for the task that you want to perform as listed in the following table:

Task	Action
Viewing the virtual service resources that are contained in a branch of any of the repositories that are added to your project.	Select the branch of the repository that contains the virtual services that you want to run from the list in the Branch field. All virtual services in the selected branch are displayed on the Resources page.
Creating or using saved filters for viewing specific instances of virtual service resources.	To create a query, perform the following actions: a. Click New filter . b. Create a rule with an appropriate operator. c. Select criteria such as <i>Name</i> , <i>Path</i> , <i>Instance number</i> , or <i>Instance state</i> . d. Select the condition, and then enter the value for the criteria. e. Apply the filter query.

Task	Action
	The virtual services that match the filter criteria are displayed.
	f. Save the filter query for retrieving it from the saved filters list.
	To use a saved filter query, perform the following actions:
	Note: To open the filter query, you must have created and saved a filter query.
	a. Click the Open filters icon
	b. Select the saved filter.
	c. Apply the filter.
	The virtual services that match the filter criteria in the filter that is applied are displayed.
Running an instance of the virtual	After you identify the virtual service that you want to run, perform the
service resource.	following actions:
	a. Click the Execute icon in the row of the identified virtual service.
	The Execute virtual service dialog box is displayed.
	 b. Run the virtual service with the settings that are configured in the resource by clicking Execute or modify any of the settings, and then click Execute.
	An instance of the virtual service starts to run. The virtual service is displayed with the state as Running along with the number of instances that are running in the Active instances column.
Viewing the number of instances	If any of the virtual services in the project repositories are started by
of the virtual service resources	any project member with the <i>Tester</i> or <i>Owner</i> role, you can view the
that are running.	number of instances that are running or active from the Resources page.
	The virtual services are displayed with the state as Running along with the number of instances that are running, in the Active instances column.
Viewing all instances of a running virtual service.	Click the Show in instances page icon in the row of the virtual service on the Resources page.

Task	Action
	The Instances page is displayed with all the running instances of a particular virtual service.
	You can also view the number of requests that are received by the virtual service. The number of requests is displayed as the number of hits when you hover the cursor over the text in the Activity column.

Results

You have viewed virtual services from the Resources page on Rational® Test Automation Server.

Configuring a run of a virtual service on page 235

Configuring a run of a virtual service

When you have virtual service resources that are in the repositories added to your project, you must configure a run of the virtual service to start an instance of the virtual service on IBM® Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Been assigned the Tester or Owner role in the project to run virtual services.
- Created virtual services that use the HTTP or IBM® WebSphere® MQ transport for tests in HCL OneTest™ API, committed the test resources to the remote repository, and added the repository to your project.
- Completed the prerequisite tasks before you configure a run of the HTTP stubs. See Prerequisites for running HTTP virtual services on page 227.
- Read the prerequisite information about virtualizing the Istio based services before you can run the virtualized service on Rational® Test Automation Server. See Prerequisites for running virtualized Istio based services in IBM Rational Test Automation Server on page 229.

About this task

You can start the following types of stubs contained in API Suites from the **Resources** page on Rational® Test Automation Server:

- · Virtual services that utilize the WebSphere® MQ transport.
- Virtual services that utilize the HTTP transport.
- Virtual services that virtualize the Istio based services. You can run virtual services for the following types of requests received or sent by the Istio service mesh:

- Requests received by services in the Istio service mesh.
- Requests sent from namespaces in the Istio service mesh to external services that are not in the Istio service mesh.
- 1. Log in to Rational® Test Automation Server.
- Open the project that contains the virtual service resources in the test assets by clicking Projects > My Projects > project_name.

The Overview page is displayed.

3. Click Virtualization > Resources in the navigation pane.

The Resources page is displayed.

4. Select the branch of the repository that contains the virtual services that you want to run from the list in the **Branch** field.

All virtual services in the selected branch are displayed on the **Resources** page.

- 5. Identify the virtual service that you want to run by completing any of the following steps:
 - Search for the virtual service by entering the name or the path of the virtual service in the repository in the **Search** field box.
 - Create a filter query by using the **New filter** option and complete the following steps:
 - a. Create a rule with an appropriate operator.
 - b. Select criteria such as *Name*, *Path*, *Instance number*, or *Instance state*. Select the condition and enter the value for the criteria. Apply the filter query.

The virtual services that match the filter criteria are displayed.

- c. Save the filter query for retrieving it from the saved filters list.
- Retrieve a saved filter by using the **Open filters** icon \rightleftharpoons by completing the following steps:

Note: To open the filter query, you must have created and saved a filter query.

- a. Select the saved filter.
- b. Apply the filter.

The virtual services that match the filter criteria in the filter that is applied are displayed.

6. Click the **Execute** icon in the row of the identified virtual service.

The Execute virtual service dialog box is displayed.

7. Select the version of the virtual service that is in the repository that you want to start by performing any of the following actions:

• Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- · Commit message.
- Tags labeled for the version committed.
- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version committed followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

8. Select the environment that was used to bind the physical and logical resource in the API project, in the **ENVIRONMENT** tab.

Important: The configuration that you set for the run in the **Execute virtual service** dialog box is preserved when you run the same virtual service again. The configurations that you set are not available to other members when they want to run the virtual service. For example, if you selected an environment, the same environment is selected when you run the virtual service again.

9. Enter a label, if required.

A label that you enter for the test run that helps you to identify the virtual service instance on the **Instances** page. The label that you entered is displayed for the virtual service under the **Labels** column on the **Instances** page. After you have created a label, any member of the project can use that label.

- 10. Follow the instructions if you want to modify the configurations for the behavior of the virtual service:
 - a. Click the $\mbox{\bf BEHAVIOR}$ tab, if it is not already open.
 - b. Configure or change the settings for the following options:

Note: The settings displayed are the settings that were configured for the virtual service when it was authored in Rational® Integration Tester.

Option	Description
Performance	The following settings are available for handling of requests by the virtual service:

Option	Description		
	Option		Description
	Optimize per	formance	If enabled, attempts are made to reduce the amount of processing between the time the virtual service receives a request and the time it sends a response. Specific optimizations depend on the message contents, as in the following examples: • When the virtual service receives requests, all validations are disabled, and for all XML payloads, the store and filter actions are converted to use XPath expressions. • When the virtualization sends responses, any store actions set on a message are disabled, and any XML content is collapsed when the virtual service is compiled instead of being collapsed every time that a response is sent. The optimization is disabled as the default action for this setting and you can enable the performance optimization if you fully understand the implications of optimizing the performance.
	Threads		The maximum number of threads used in processing requests received by the virtual service. The default number of threads is 10.
Operation	Specifies an o	peration referen	ced by the virtual service.
Response time	Specifies the response time behavior for responses sent by the virtual service for the selected operation. You can modify the value by selecting a value from the following options:		
	Option		Description
	No delay	Select this opti	on for a response with no delay.

Option	Description		
	Option	Description	
	Minimum delay	Select this option for a delay in the response by entering the required delay in milliseconds (ms).	
	Uniform dis- tribution	Select this option for a uniformly distributed response time by specifying the minimum and maximum delay in milliseconds (ms).	
	Gaussian distribution	Select this option for a response time with Gaussian distribution by specifying the minimum and maximum delay in milliseconds (ms).	
Passthrough	Specifies the pass through behavior for the selected operation when requests are not handled within the virtual service.		
	You can modify the value by selecting a value from the following options:		
	Discard	This option stops the system under test from receiving the intercepted message. This option can disrupt the calling system. For example, the system might time out while it waits for a reply.	
	Pass Through	This option passes the intercepted message to the system under test, with an optional delay.	
	Simulate Error	This option returns an error to the calling system. The message is not passed to the system under test.	

- 11. Follow the instructions, if the virtual service references datasets.
 - You can use the dataset referenced in the asset.
 - You can choose to override the dataset with another data source. If alternative data sources are available, select from the set of overrides available.
- 12. Follow the instructions if the virtual service requires a variable that must be passed at run time.
 - a. Click the VARIABLES tab, if it is not already open.
 - b. Choose one of the following methods to add the variables:

- To add new variables from your local computer or from the Git repository that is associated with your server project, click the Upload icon
 and select the Upload from local system or Browse from server to select the variable file.

Note: You must have created a file with the variables before you can select the file.

- 13. Click **Advanced** to make the following advanced configurations:
 - a. Enter any JVM arguments that must be passed at run time in the JVM Arguments field.

Note: Each JVM argument should be separated with white space.

For example, you can set a maximum Java heap size.

b. Enter the environment variables that must be passed at run time in the **Environment Variables** field, if applicable.

For example, enter the environment variables when the third-party libraries that are used in the run refer to the environment variables for configuration.

c. Select the stub logging level for the virtual service from the following options in the **Logging** list:

Option	Description
None	Specifies that the virtual service does not write log messages.
Normal	Specifies that the virtual service writes informational messages.
Debug	Specifies that the virtual service writes informational and debugging messages.

d. Enter other configuration options as parameters and their values in the **Additional Configuration**Parameters fields, if applicable.

You can refer to the additional parameters that you can use for virtual services from the topic in the related links. For example, if you want to start the virtual service to run in a new container, you can specify the following parameter and its value:

Parameter name	Value
execution.stub.dedicated.container	true

Note: Click Add to add additional parameters.

Note: You must separate the arguments or variables with a white space when you enter them in the same line or start each argument or variable on a new line.

The default value for the fields for the advanced settings is null or an empty field.

- If you have configured some or all of the settings for the current run, and you do not want to continue with those settings, you can reset the settings by clicking Reset.
- If you want to repeat a run and do not want to use the saved settings from a previous run, you
 can reset all the saved settings to their default values by clicking Reset.

14. Click Execute.

Results

You have started a virtual service from the **Resources** page on Rational® Test Automation Server.

What to do next

After you start a run of a virtual service, you can view the status of the virtual service in any of the following ways:

- On the **Resources** page, the virtual services are displayed with the state as Running along with the number of instances that are running in the **Active instances** column.
- On the **Resources** page, you must click the **Show in instances page** icon in the row of the virtual service to view all the running instances of a particular virtual service on the **Instances** page.
- Go to the **Instances** page by clicking **Virtualization > Instances**. You can view instances of all the virtual services that are running and are displayed with the state as Running under the **State** column. You can also view the requests that are received by the virtual service. The number of requests is displayed as number of hits when you hover the cursor over the text in the **Activity** column.

You can view the details, configuration settings, routing rules, usage statistics, or logs of a specific running instance of the virtual service. See Viewing configurations of running instances of virtual services on page 256.

You can modify the behavior or the logging level of a running instance of the virtual service that you started before running tests on them. See Modifying configurations of running instances of virtual services on page 260.

When you have completed testing the virtual service, you must stop the running virtual service. See Stopping a virtual service on page 266.

Additional configuration parameters for virtual services on page 242

Additional configuration parameters for virtual services

You can find information about the additional configuration parameters that you can set when you want to run virtual services on Rational® Test Automation Server.

When you use the server UI to start the virtual service, some of the parameters are handled by fields in the **Execute virtual service** dialog box.

You can enter the other parameters as a *name-value* pair in the **Additional configuration parameters** field that is displayed in the **Advanced** settings panel of the **Execute virtual service** dialog box.

The following additional configuration parameters are supported when you configure a run for a virtual service.

Requirement	Configuration para- meter name	Supported values	An example value	Result of using the example value
To specify a unique identifier for use in the generated host name	stub.ingress.host.i- dentifier	Any <custom_id> that you specify.</custom_id>	mystub	See Running HTTP virtual services without using proxies on page 247, to know how the identifier you specified is used.
To specify whether a virtual service instance should be run in a dedicated container.	stub.dedicated.con- tainer	• true • false Note: The default value is false.	true	A dedicated container is used to run a single virtual service instance.
To specify whether performance optimization is enabled	stub.performance.op- timize	• true • false	true	The performance optimization is enabled for the virtual service.

Requirement	Configuration para- meter name	Supported values	An example value	Result of using the example value
for the virtual service instance. The value set overrides the setting from the stub definition. This option can be set in the Behavior tab from the UI.		Note: The default value is false.		
To specify the number of threads to be used for processing requests for the virtual service instance. The value set overrides the setting from the stub definition. This option can be set in the Behavior tab from the UI.	stub.worker.threadcount	Any number that you specify as number of threads to use.	15	15 threads are used for processing requests for the virtual service instance.
To specify the stub logging level for the virtual service instance. The value set overrides the setting from the stub definition. This option can be set in the Advanced settings from the UI.	stub.logging.level	• none • normal • debug	debug	The virtual service writes informational and debugging messages to the container log.
To specify the pass- through behaviour type of the virtual ser- vice instance. The value set overrides	stub.pass.throughbehavior	Valid values depend on the stub operation transport type but can be as follows:	simulate_error	This option returns an error to the calling system. The message is not passed to the system under test.

Requirement	Configuration para- meter name	Supported values	An example value	Result of using the example value
the setting from the stub definition. This option can be set in the Behavior tab from the UI.		simulate_errordiscardpass_through		
To specify the delay in passing through from the virtual service instance. The value set overrides the setting from the stub definition.	stub.pass.throughdelay.period	Any number of seconds in milliseconds.	10000	A delay of 10 seconds in passing through from the virtual service instance.
To specify the status code to use in the virtual service instance response when simulating an error. The value set overrides the setting from the stub definition. Note: Applies to HTTP stubs. This option can be set in the Behavior tab from the UI.	stub.pass.through.s-tatus.code	You must specify a valid HTTP status code as the value. For example, 503.	500	The HTTP error code of 500 is sent in the response if the virtual service simulates an error when passing through.
To specify the reason phrase to use in the virtual service instance response when simulating an error. The value set overrides the setting from the stub definition.	stub.pass.throughreason.phrase	You must specify the text of the status message as the val- ue.	my custom error msg	The text that you specify is set as the HTTP reason phrase in the response if the virtual service simulates an error when passing through.

Requirement	Configuration parameter name	Supported values	An example value	Result of using the example value
Note: Applies to HTTP stubs.				
This option can be set in the Behavior tab from the UI.				
To specify the type of response-time behavior that is required for the virtual service instance. The value set overrides the setting from the stub definition.	stub.response.timetype	 no_delay minimum_de- lay gaussian uniform performance profile 	no_delay	The virtual service sends a response without any delay.
This option can be set in the Behavior tab from the UI.		Note: performance_profile is only valid if the stub operation in the stub definition is defined to use a performance profile.		
To specify the minimum time for the response time behaviour required for the virtual service instance. The value set overrides the setting from the stub definition.	stub.response.timeminimum	Any number of seconds in milliseconds.	5000	The virtual service sends a response after a minimum delay of 5 seconds.

Requirement	Configuration para- meter name	Supported values	An example value	Result of using the example value
This option can be set in the Behavior tab from the UI.				
To specify the maximum time for the response time behaviour required for the virtual service instance. The value set overrides the setting from the stub definition. This option can be set in the Behavior tab from the UI.	stub.response.timemaximum	Any number of seconds in milliseconds.	20000	The virtual service must send a re- sponse after a maxi- mum delay of 20 sec- onds.

Virtual services where the stub definition refers to multiple operations

When a stub definition has two or more events that refer to different operations and each operation has a different behavior, you must specify the *<operation_id>* suffixed to the configuration parameter name in the **Additional** configuration parameters field.

Note: The *<operation_id>* is the internal ID of the operation that is found in the **Documentation** tab when you open the operation in Rational® Integration Tester.

When the stub definition refers to multiple operations and you want to start a run of a virtual service, you must append the *<operation_id>* to the *<parameter_name>* in the **Additional configuration parameters** field.

The configuration parameter names that you must use for the virtual service, which is associated with a particular operation are as follows:

- stub.pass.through.behavior.<operation_id>
- stub.pass.through.delay.period.<operation_id>
- stub.pass.through.status.code.<operation_id>
- stub.pass.through.reason.phrase.coperation_id>
- stub.response.time.type.<operation_id>
- stub.response.time.<operation_id>
- stub.response.time.maximum.<operation_id>

For example, if the *<operation_id>* is 7281b750:162483a09f1:-7e68, the parameter name for the stub.response.time.type option that you must specify is stub.response.time.type.7281b750:162483a09f1:-7e68.

Related information

Configuring a run of a virtual service on page 235

Running HTTP virtual services without using proxies

When you run HTTP virtual services on Rational® Test Automation Server, the endpoint on which the virtual service is exposed externally uses a host name that includes a generated ID. If a client application is required to call the virtual service directly via its external host name and not via the HTTP proxy, then you might want to determine the host name to configure the client first before you start the virtual service.

Before you begin

You must have completed the following tasks:

- Been assigned the Tester or Owner role in the project to run the virtual services.
- Created a project on Rational® Test Automation Server and added the repository that contains the HTTP virtual services.
- Completed the prerequisite tasks before you start HTTP virtual services. See Prerequisites for running HTTP virtual services on page 227.
- Selected the branch of the Git repository to view test resources on the **Execution** page.

About this task

When you installed Rational® Test Automation Server on Ubuntu, the default HTTP stub endpoints are of the following form:

```
in-<unique_id>.<ingress_domain>
```

For example, with an ingress domain as 10.1.2.3.nip.io, a stub endpoint might be as follows:

```
in-cd3a755635574c6fa7e264911301821a.10.1.2.3.nip.io
```

When you installed Rational® Test Automation Server on OpenShift, the default HTTP stub endpoints are of the following form:

```
<ingress_domain_first_label>-<unique_id>.<remainder_of_ingress_domain>
```

For example, with an ingress domain as **rtas.mycluster-123456-0000.region.containers.appdomain.cloud**, a stub endpoint might be as follows:

The <unique_id> is generated when the stub is started. The full host name can be viewed in the **Routing to** field of the routing rule created for the stub on the **Intercept Rules** page. When traffic is routed to the stubs via the HTTP proxy, a client application is unaware of this host name. If the client application is required to call the stubs directly, it must

be aware of the stub host name. To allow a host name to be known before you start the stub, you can replace the generated ID with a value that you specify.

- The value of the <unique_id> that you specify is used as the <unique_id> for the stub.
- The <unique_id> must start and end with an alphanumeric character. The characters supported include a-z, 0-9, and a hyphen. No other characters can be used in the <unique_id>.
- The <unique_id> must be unique to a stub that is running.

Restriction: You must not assign the same **<unique_id>** to another stub that is running simultaneously. Doing so might result in an undefined behavior of the stub.

For example, on Ubuntu, if you specify the value of the *<custom_id>* for the stub as stub123-test and Rational® Test Automation Server has an ingress domain as **10.1.2.3.nip.io**. Then the host name of the stub endpoint is as follows:

in-stub123-test.10.1.2.3.nip.io

- 1. Log in to Rational® Test Automation Server.
- Open the project that contains the virtual service resources in the test assets by clicking Projects > My Projects > project_name.

The **Overview** page is displayed.

3. Click Virtualization > Resources in the navigation pane.

The **Resources** page is displayed.

4. Select the branch of the repository that contains the virtual services that you want to run from the list in the **Branch** field.

All virtual services in the selected branch are displayed on the **Resources** page.

- 5. Identify the virtual service that you want to run.
- 6. Click the **Execute** icon in the row of the identified virtual service.

The **Execute virtual service** dialog box is displayed.

- 7. Select the version of the virtual service that is in the repository that you want to start by performing any of the following actions:
 - Expand the list in the Version field, find the version of the test resources, and then select the version.

Use the following details about the version of the test resources that are displayed to identify the version that you want:

- Commit message.
- Tags labeled for the version committed.

- The user who committed the version to the repository.
- Relative time of the commit. For example, 2 hours ago or 3 days ago.

The list displays the versions of the test resources committed by all users to the branch in the repository. The versions are arranged with the latest version committed followed by the versions committed previously.

Expand the list in the Version field, and then search for the version that you want to select by entering
a partial or the complete commit message of that version.

The version that matches the search criteria is displayed and it is selected for the test run.

8. Select the environment that was used to bind the physical and logical resource in the API project, in the **ENVIRONMENT** tab.

Important: The configuration that you set for the run in the **Execute virtual service** dialog box is preserved when you run the same virtual service again. The configurations that you set are not available to other members when they want to run the virtual service. For example, if you selected an environment, the same environment is selected when you run the virtual service again.

9. Enter a label, if required.

A label that you enter for the test run that helps you to identify the virtual service instance on the **Instances** page. The label that you entered is displayed for the virtual service under the **Labels** column on the **Instances** page. After you have created a label, any member of the project can use that label.

- 10. Follow the instructions if you want to modify the configurations for the behavior of the virtual service:
 - a. Click the BEHAVIOR tab, if it is not already open.
 - b. Configure or change the settings for the following options:

Note: The settings displayed are the settings that were configured for the virtual service when it was authored in Rational® Integration Tester.

Option	Description		
Performance	The following settings are available for handling of requests by the virtual service:		
	Option Description		
	Optimize performance	If enabled, attempts are made to reduce the amount of processing between the time the virtual service receives a request and the time it sends a response. Specific optimizations de-

	Option	Description		
		pend on the message contents, as in the following examples:		
		When the virtual service receives re-		
		quests, all validations are disabled, and		
		for all XML payloads, the store and filter		
		actions are converted to use XPath expressions.		
		 When the virtualization sends respons- 		
		es, any store actions set on a message are disabled, and any XML content is col-		
		lapsed when the virtual service is com- piled instead of being collapsed every time that a response is sent.		
		The optimization is disabled as the default ac-		
		tion for this setting and you can enable the per-		
		formance optimization if you fully understand		
		the implications of optimizing the performance.		
	Threads	The maximum number of threads used in processing requests received by the virtual service.		
		The default number of threads is 10.		
Operation	Specifies an o	operation referenced by the virtual service.		
Response time	Specifies the response time behavior for responses sent by the virtual service for the selected operation.			
	You can modi	can modify the value by selecting a value from the following options:		
	Option	Description		
	No delay	Select this option for a response with no delay.		
	Minimum delay	Select this option for a delay in the response by entering the required delay in milliseconds (ms).		

Option	Description		
	Option	Description	
	Uniform dis- tribution	Select this option for a uniformly distributed response time by specifying the minimum and maximum delay in milliseconds (ms).	
	Gaussian distribution	Select this option for a response time with Gaussian distribution by specifying the minimum and maximum delay in milliseconds (ms).	
Passthrough	Specifies the pass through behavior for the selected operation when requests are not handled within the virtual service. You can modify the value by selecting a value from the following options:		
	Discard	This option stops the system under test from receiving the intercepted message. This option can disrupt the calling system. For example, the system might time out while it waits for a reply.	
	Pass Through	This option passes the intercepted message to the system under test, with an optional delay.	
	Simulate Error	This option returns an error to the calling system. The message is not passed to the system under test.	

- 11. Click **Advanced** to make the following advanced configurations:
 - a. Enter the following configuration options as parameters and their values in the Additional Configuration Parameters fields.

Parameter name	Value
execution.ingress.host.identifier	<custom_id></custom_id>

12. Click Execute.

Results

You have started an HTTP virtual service that does not use a proxy. The virtual service exposes the host name that contains a custom ID that you specified.

What to do next

After you start a run of a virtual service, you can view the status of the virtual service in any of the following ways:

- On the **Resources** page, the virtual services are displayed with the state as Running along with the number of instances that are running in the **Active instances** column.
- On the **Resources** page, you must click the **Show in instances page** icon in the row of the virtual service to view all the running instances of a particular virtual service on the **Instances** page.
- Go to the **Instances** page by clicking **Virtualization > Instances**. You can view instances of all the virtual services that are running and are displayed with the state as Running under the **State** column. You can also view the requests that are received by the virtual service. The number of requests is displayed as number of hits when you hover the cursor over the text in the **Activity** column.

Viewing running instances of virtual services

After you start virtual services from the **Resources** page, you can view the instances of the virtual services that are running from the **Instances** page in IBM® Rational® Test Automation Server. You can view the details, configuration settings, routing rules, usage statistics, or logs of a specific running instance of the virtual service. You can also stop the running instance.

Before you begin

You must have completed the following tasks:

- Started the virtual service resources as a *Tester* or *Owner* from the **Resources** page.
- Been assigned the *Viewer, Tester*, or *Owner* role in the project so that you can view the virtual services that are running.

About this task

After you started the virtual services from the **Resources** page on Rational® Test Automation Server, you can go to the **Instances** page and you can perform the following tasks:

- · View all running instances of the virtual services that are contained in the project repositories.
- · Search for a specific instance of the virtual service for which you want to view the details.
- Create or use saved filters for viewing specific running instances of the virtual service.
- View the details, configuration settings, routing rules, usage statistics, or logs of a specific running instance of the virtual service.
- Change the behavior or logging level of a running instance of the virtual service before you run tests on the virtual service.
- Stop a specific running instance of the virtual service.
- 1. Log in to Rational® Test Automation Server.
- Open the project that contains the virtual services in the test assets by clicking Projects > My Projects > project_name.
 - The Overview page is displayed.
- 3. Click Virtualization > Instances in the navigation pane.

The Instances page is displayed.

You can view all running instances of the virtual services that you started and the instances that were started by other members of the project. You can find the following information about the running instances that are displayed on the **Instances** page.

- The name and path of the virtual service in the project repository are displayed in the Name column.
- The tags or labels added to the instance when the run was configured is displayed in the Labels column.
- The name of the environment associated with the operation in which the virtual service was created in Rational® Integration Tester is displayed in the **Environment** column.
- The state of the running instance is displayed as Running in the **State** column.
- The activity of the running instance of the virtual service based on the number of requests received
 in the previous hour is displayed in the **Activity** column. The activities are classified and displayed as
 indicated in the following table:

Activity load	Activity displayed as
Received 0 requests	None
Received 1 - 10 requests	Low
Received 11 - 100 requests	Mid
Received 101 - 1000 requests	High
Received more than 1000 requests	Very High

- The **Stop** icon is displayed in the **Actions** column and stops the running instance of the virtual service, when clicked.
- 4. Complete the steps for the task that you want to perform as listed in the following table:

Task	Action
Searching for a specific instance of the virtual service for which you want to view the details or want to stop the instance.	Enter either the complete text or part of the text in the name or the path of the virtual service that is in the repository in the Search field. The instances of the virtual services that match the text searched are displayed.
Creating or using saved filters for viewing specific instances of virtual service resources.	To create a query, perform the following actions: a. Click New filter . b. Create a rule with an appropriate operator. c. Select criteria such as <i>Name</i> , <i>Path</i> , <i>Instance number</i> , or <i>Instance state</i> . d. Select the condition, and then enter the value for the criteria.

Task	Action
	e. Apply the filter query.
	The virtual services that match the filter criteria are displayed.
	f. Save the filter query for retrieving it from the saved filters list.
	To use a saved filter query, perform the following actions:
	To use a saved filter query, perform the following actions.
	Note: To open the filter query, you must have created and saved
	a filter query.
	a. Click the Open filters icon
	b. Select the saved filter.
	c. Apply the filter.
	G. Apply the litter.
	The virtual services that match the filter criteria in the filter that
	is applied are displayed.
Viewing the details, configuration	After you identify the virtual service instance for which you want to view
settings, routing rules, usage sta-	the details, perform the following actions:
tistics, or logs of a specific running	a. Click the Expand icon in the row of the identified instance of
instance of the virtual service.	the virtual service.
	The Details panel of the instance is displayed. You can find the
	following details about the instance displayed:
	• Name
	• Path
	• Labels
	API Environment
	 Version

	Started by
	 Associated components
	 Documentation
	b. Click Behavior to expand the panel and view the behavior that
	was configured for the virtual service.
	c. Click Routing Rules to expand the panel and view the routing
	rules that were configured in the virtual service.
	d. Click Statistics to expand the panel and view the graphical rep-
	resentation of the activities performed by the virtual service.
	e. Click Diagnostics to expand the panel and view the logging configuration of the virtual corving and the links to the logs.
	figuration of the virtual service and the links to the logs.

Task	Action
Changing the behavior or logging level of a running instance of the virtual service.	After you identify the virtual service instance for which you want to view the details, perform the following actions: a. Click the Expand icon in the row of the identified instance of
	the virtual service.
	The Details panel of the instance is displayed.
	b. Click Behavior to expand the panel.
	Perform the following steps to change the behavior configura-
	tions:
	i. Click the Edit icon <mark></mark> .
	ii. Select a different operation for the virtual service, if available.
	iii. Select a different response time and enter the values for
	the delay you want to set.
	iv. Click apply .
	c. Click Diagnostics to expand the panel.
	Perform the following steps to change the logging level configu-
	ration:
	i. Click the Edit icon 🚄.
	ii. Select a different logging level.
	iii. Click apply .
Stop a specific running instance of the virtual service.	Click the Stop icon in the row of the virtual service instance.

Results

You have viewed running instances of the virtual services from the **Instances** page on Rational® Test Automation Server.

What to do next

You can perform the following tasks:

- View the configurations of a running instance of the virtual service. See Viewing configurations of running instances of virtual services on page 256.
- Modify the behavior or logging level of a running instance of the virtual service before you run tests on the virtual service. See Modifying configurations of running instances of virtual services on page 260.
- Stop a running instance of the virtual service. See Stopping a virtual service on page 266.

Viewing configurations of running instances of virtual services

After you start virtual services from the **Resources** page, you can view the details, configuration settings, routing rules, usage statistics, or logs of a specific running virtual service instance from the **Instances** page on IBM® Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Been assigned the *Viewer*, *Tester*, or *Owner* role in the project so that you can view the virtual services that are running.
- Started the virtual service resources as a Tester or Owner from the Resources page.

About this task

After you have started the virtual services from the **Resources** page on Rational® Test Automation Server, you can go to the **Instances** page and view the information about a specific running virtual service instance.

- 1. Log in to Rational® Test Automation Server.
- Open the project that contains the virtual services in the test assets by clicking Projects > My Projects > project_name.

The Overview page is displayed.

3. Click Virtualization > Instances in the navigation pane.

The Instances page is displayed with all running instances of the virtual services that are in your project.

- 4. Identify the running instance of the virtual service of which you want to view the details, configuration settings, and other information.
- 5. Click the **Expand** icon of the instance of the virtual service.

The Details panel of the instance is displayed with the following details about the virtual service instance:

Note: The information displayed pertains to the configuration settings that were configured in the virtual service at the time it was created or run.

Option	Information displayed
Name	Displays the name of the virtual service.
Path	Displays the path of the virtual service resource in the project repository.
Labels	Displays the labels or tags that were entered for the virtual service when a run of the virtual service was configured.

Option	Information displayed
API Environment	Displays the name of the environment associated with the operation in which the virtual service was created in Rational® Integration Tester or the environment selected for the run.
Version	Displays the version of the virtual service resource that is in the project repository that was started as an instance.
Started at	Displays the date and time when the virtual service instance started.
Started by	Displays the name of the project member who started the virtual service instance.
Associated components	Displays the components in the system model that are associated with the virtual service.
Documentation	Displays the text that was entered on the Documentation tab of the Stub Editor when the virtual service was created in Rational® Integration Tester.

The other panels that you can view are as follows:

- Behavior
- Routing Rules
- Statistics
- Diagnostics
- 6. Expand each panel by clicking the panel to view the information in that panel.

You can view the following information in the different panels:

Panel	Details			
Behavior	The Behavior panel of the instance is displayed when expanded with the following details about the virtual service instance: Note: The information displayed pertains to the configuration settings that were configured in the virtual service at the time it was created or run.			
	Option Information displayed			
	Performance	Displays the optimization setting and the maximum number of threads in use by the virtual service.		
	Operation	Displays the operations referenced by the virtual service. You can select each operation to view the related response time and the pass through settings.		
	Response time	Displays the response time option that is in use for the selected operation within the virtual service.		

Panel	Details	Details			
	Option	Inf	Information displayed		
	Passthrou	Dis		s the pass through option that is in use for the selected op- within the virtual service.	
Routing Rules	The Routing	outing Rules panel of the instance is displayed when expanded.

	Init container log	Displays the link to the log of the Init container.	
		Note: This logs contains messages that relate to configuring the container which is ready to run the virtual service.	
	Main container log	Displays the link to the log of the main container. This log contains messages logged by the virtual service based on the selected logging level.	

Results

You have viewed the information about the configuration, routing rules, usage, or logs of the virtual service instance.

What to do next

You can modify the behavior or logging level configurations of the running virtual service instance before you run tests on the instance. See Modifying configurations of running instances of virtual services on page 260.

Related information

Configuring a run of a virtual service on page 235

Modifying configurations of running instances of virtual services

After you start virtual services from the **Resources** page and before you run tests on the virtual service, you might want to modify the configurations for the behavior or the logging level of the running instance.

Before you begin

You must have completed the following tasks:

- Been assigned the *Viewer, Tester*, or *Owner* role in the project so that you can view the virtual services that are running.
- Started the virtual service resources as a *Tester* or *Owner* from the **Resources** page.

About this task

After you have started the virtual services from the **Resources** page on IBM® Rational® Test Automation Server, you can go to the **Instances** page and identify the running instance of the virtual service for which you want to modify the configurations. You can modify the configurations for the behavior or logging levels of the running instance of the virtual service.

- 1. Log in to Rational® Test Automation Server.
- Open the project that contains the virtual services in the test assets by clicking Projects > My Projects > project_name.

The Overview page is displayed.

3. Click Virtualization > Instances in the navigation pane.

The Instances page is displayed with all running instances of the virtual services that are in your project.

- 4. Identify the running instance of the virtual service for which you want to modify the configurations.
- 5. Click the **Expand** icon of the instance that you want to modify the configurations.

The **Details** panel of the instance is displayed.

- 6. Click **Behavior** to expand the panel and perform the following steps to change the configurations:
 - a. Click the **Edit** icon ...

The options that you can modify are enabled for editing.

- b. Select a different operation for the virtual service, if available, from the list for the **Operation** option.
- c. Select a different response time from the list for the **Response time** option, and then enter the values for the delay that you want to set.

You can modify the value by selecting a value from the following options:

Option	Description			
No delay	Select this option for a response with no delay.			
Minimum delay	Select this option for a delay in the response by entering the required delay in milliseconds (ms).			
Uniform distribution	Select this option for a uniformly distributed response time by specifying the minimum and maximum delay in milliseconds (ms).			
Gaussian distri- bution	Select this option for a response time with Gaussian distribution by specifying the minimum and maximum delay in milliseconds (ms).			

- d. Click apply to apply the modified settings.
- 7. Click **Diagnostics** to expand the panel and perform the following steps to change the logging level that is configured:

a. Click the **Edit** icon <a>.

The Logging level option is enabled for editing.

b. Select a different logging level from the following options.

Option	Description
None	Specifies that the virtual service does not write log messages.
Normal	Specifies that the virtual service writes informational messages.
Debug	Specifies that the virtual service writes informational and debugging messages.

c. Click apply to apply the modified settings.

Results

You have viewed and modified the configurations of a running virtual service instance from the **Instances** page on Rational® Test Automation Server.

What to do next

You can run tests that are in an API Suite in your project, which then run on the virtual service instance. See Configuring an API Suite run on page 171.

Viewing routing rules of the virtual services

When you run virtual services that are created to run on proxies or intercepts and have routing rules defined, you can view the proxies or intercepts and the routing rules from the **Intercept Rules** page.

Before you begin

You must have completed the following tasks:

- Started the virtual service resources as a Tester or Owner from the Resources page.
- Been assigned the *Viewer, Tester*, or *Owner* role so that you can view the routing rules defined for the virtual services from the **Intercept Rules** page.

About this task

After you run the virtual service resources that are in your project on Rational® Test Automation Server, you can view the routing rules for the running instances of the virtual service resources, from the **Intercept Rules** page.

- 1. Log in to Rational® Test Automation Server.
- 2. Open the project that contains the stubs in the test assets by clicking Projects > My Projects > project_name.

The **Overview** page is displayed.

3. Click **Virtualization > Intercept Rules** in the navigation pane.

The Intercept Rules page is displayed.

The agents, proxies, or intercepts that are configured in the virtual service resources that are in your project are displayed.

You can find the following information that is displayed on the Intercept Rules page.

Column	Description	
Activity	Lists the agent or proxy.	
Target	Lists a summary view of the endpoint that was recorded or virtualized.	
Recipient	Lists the destination where messages sent to are captured.	

4. Expand the proxy or intercept panel by clicking the **Expand** icon .

5. Click each tab to view the following information:

Tab	Description	Description				
Details	The Details pa	The Details panel provides the following information:				
	Option	Description				
	Condition	Lists the condition that causes the traffic to be recorded or routed to a virtual service.				
		You can view the detailed condition of the rule defined for the proxy or intercept by clicking the View icon .				
		The detailed condition of the rule is displayed in the Full condition window.				
		Note: You can copy the detailed condition if you intend to use it elsewhere.				
	Routing to	Lists the virtual service to which traffic is routed.				
	Created by	Lists the user who created the rule.				
	Created at	Lists the date and time when the rule was created.				
Activity		The Activity panel lists the log of the activities performed by the proxy or intercept. This panel also displays the details of the activity, date and time, and message for that activity.				

Results

You have viewed the routing rules for the virtual service, proxy, or intercept that are running or connected to Rational® Test Automation Server.

What to do next

You can perform any of the following tasks:

- You can view the usage statistics of the virtual services that are running. See Viewing usage statistics of virtual services on page 264.
- You can stop the stubs that are running on Rational® Test Automation Server. See Stopping a virtual service on page 266.

Related information

Management of virtualized services on page 226

Viewing usage statistics of virtual services

After you start stubs or virtual service resources that are in the project repositories, and then run tests on the virtual service, you can view the usage statistics of the virtual services from the **Usage** page on IBM® Rational® Test Automation Server.

Before you begin

You must have completed the following tasks:

- Started the virtual service resources as a Tester or Owner from the Resources page.
- Been assigned the *Viewer, Tester*, or *Owner* role in the project so that you can view the usage details of virtual services.
- Ran API Suites with tests that run on the virtual service resources that are configured.

About this task

After you run the virtual services that are in a project, you can view details of the usage statistics of the virtual services from the **Usage** page on Rational® Test Automation Server.

Important: The settings such as the **Period**, or **From** and **To** that you configure to view the usage details are retained for you during your ongoing session and the settings are retained even when you perform the following activities:

- Log out of the server and log in again.
- · Log in after a server restart.
- 1. Log in to Rational® Test Automation Server.
- 2. Open the project that contains the stubs in the test assets by clicking Projects > My Projects > project_name.

The Overview page is displayed.

3. Click Virtualization > Usage in the navigation pane.

The Virtual Service Usage page is displayed.

The total requests that were received by all virtual services on the server are displayed as a graph.

The default view displays the usage data of the virtual services that are gathered during the previous week and grouped in an hourly interval. The total requests received from when the virtual service was started are displayed.

The metric data that is reported is for the number of requests that are received by a virtual service. The requests can be requests, messages, or other calls that are received by the virtual service.

4. Change the default settings to view the graph for the period for which you want to view the usage.

You can change the default view by selecting an option from the following options:

Option	Description	
1 Hour	Displays the usage data of the virtual service that are gathered during the previous hour and grouped in a 20-second interval.	
1 Day	Displays the usage data of the virtual service that are gathered during the previous day and grouped in an eight-minute interval.	
1 Week	Displays the usage data of the virtual service that are gathered during the previous week and grouped in an hourly interval. Note: This is the default view.	
Range	Displays the usage data of the virtual service that are gathered during the date range specified in the From and To fields. You can select the date and time for both the From and To fields. The data is dynamically grouped in intervals that depend on the range selected.	

Note: You can refresh the view at any time to present the graph for the latest data by clicking Refresh.

5. View details of the virtual service by hovering the mouse over any of the data-points to view the details at that point.

The following details about the virtual service are displayed when you hover the mouse over the data-point:

- The date and time of the request received.
- The number of requests received.

Results

You have viewed the usage details of the virtual services in your project that ran on Rational® Test Automation Server.

What to do next

You can perform any of the following tasks:

- · You can view the routing rules defined in the virtual service, agent, proxy, or intercept. See Viewing routing rules of the virtual services on page 262.
- · You can stop the virtual service instances that are running on Rational® Test Automation Server. See Stopping a virtual service on page 266.

Related information

Management of virtualized services on page 226

Stopping a virtual service

When you want to stop a virtual service instance that is running in IBM® Rational® Test Automation Server, you can stop the running virtual service from the **Instances** page.

Before you begin

You must have started the virtual service from the Resources page. See Configuring a run of a virtual service on page 235.

About this task

You can stop a running virtual service instance from the **Instances** page by using the **Stop** icon

- 1. Log in to Rational® Test Automation Server.
- 2. Open the project that contains the stubs in the test assets by clicking Projects > My Projects > project_name.
- 3. Go to the Instances page and identify the instance of the virtual service that you want to stop.

Note: You can stop a running stub if it is in the In Transition Or Running State.

4. Click the **Stop** icon in the **Actions** column of the virtual service.

Result

The Stop stub instance dialog box is displayed.

5. Click Ok.

A notification message is displayed that the running virtual service instance is being stopped.

Results

You have stopped a running virtual service instance. The stopped virtual service instance on the **Instances** page is displayed with the status as *Stopped by User* in the **State** column. Stopped stubs are not considered in the count of test assets run that is displayed on the **Overview** page.

What to do next

You can restart the virtual service by completing the configurations that you want from the Resources page.

You can open and view the Main container log of the stopped virtual service.

Test results

After the tests or schedules are run and completed, you can view the results and reports in IBM® Rational® Test Automation Server to analyze the verdict, the performance, and statistics. You can also re-execute tests and schedules from the **Result** page with the same commit id.

From the Results page, you can perform the following tasks:

- Searching for test results. You can filter test results by using any of the following ways:
 - By using the **Search** field to search for results by name.
 - By selecting predefined time interval from the Selection interval drop-down list.
 - By selecting **To** and **From date** from the **Date Interval** option.
 - By clicking verdict from the **Verdict summary** slider (*Pass, Fail, Inconclusive, or Error*).
 - By creating filter queries.
- · Adding labels if you have a tester or an owner role.
- Locking test results: Locked results can be unlocked by the project owner or the project member who locked the results.
- · Deleting test results.
- · Comparing performance reports.
- · Viewing trending reports.
- Viewing multiple reports depending on the test types: Statistics reports, Mobile and Web UI reports, Functional reports, Unified Reports, or HTML reports generated from Postman or JMeter test runs.

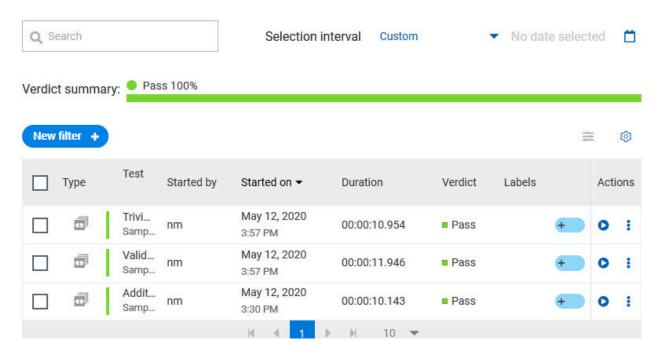

· Re-executing tests with the same commit id.

For more details, see the links in the next section of this page.

Test results and reports overview

Rational® Test Automation Server is a single location for hosting the results and reports of all tests run on different desktop clients and for tests run from the server.

Test results list

When you expand the results, the results details and reports cards are displayed.

Results, reports, and logs are generated for tests run from Rational® Test Automation Server, or from desktop clients such as Rational® Performance Tester, Rational® Functional Tester, or Rational® Integration Tester.

You must have configured the desktop clients to publish reports of tests that are run from the desktop client to the Rational® Test Automation Server. For more information about the publishing procedure, refer to the links at the end of this page.

Test result details

By using the default settings, you can view the following details about the test assets used in the test run in the Details card:

- The status of the test results, the date and time it was executed and completed.
- The details about the Git repository that contains the test assets.
- The execution location that uses the test asset for a test run.

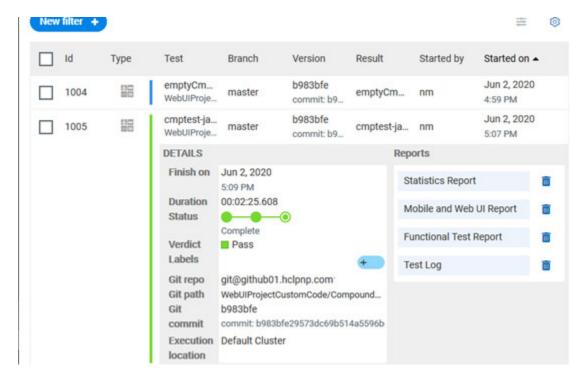

Note: The execution location can be the default cluster or the location that you indicate to override a docker host or the agent location when you execute a test. For more information about test configuration, see the link at the end of this page.

 The Resource Monitoring labels (override) used in a performance schedule to control Resource Monitoring sources. For more information about controlling Resource Monitoring sources, see the link at the end of this page.

You can configure the information displayed in the **Details** card and the **Results** columns from the **View Settings** window. You access this window by clicking the **Settings** icon .

Depending on the attribute you cleared in the **View Settings** window, the Details card displays additional information about the test results.

The selected attributes are displayed in columns of the Result view.

Reports

The Reports card contains the links to the test reports and the logs that are displayed in a web browser.

As a default configuration, test logs are delivered in a traditional format for the executed compound tests and schedules. You can still set the _history jaeger Program Argument to produce Jaeger traces when you run the tests.

The reports are generated for Compound Tests, Schedules, and Test Suites, or for other tests (Postman or JMeter tests for example). They can be run from a desktop client or from Rational® Test Automation Server.

The following table lists the reports that are generated for each type of test and the links to help pages.

Table 8. Analyzing Reports

Report	Tests type	Product	More information
	API Suite	IBM® Rational® Integration Tester	Viewing reports

Creating search queries to filter test results

To filter the test results list, you can create a search query that you apply as a filter in IBM® Rational® Test Automation Server.

About this task

You can use rules and group of rules in your query. This procedure explains how to create a query that contains two rules and a group of rules as an example, and how to select other filters.

1. Click New filter on the Result page.

Follow these steps to add a rule in your query:

- 2. Select Add a rule in your query, and enter or select the required attribute in the fields to define the rule:
 - a. Select the first attribute that you want to query in the drop-down list.

Example

Select Verdict.

b. Select the condition as equal to (=) or not equal to (!=), Contain or Not contain.

Example

Select =.

c. Select a value for the first attribute you selected.

The content of this field depends on the option you selected as first attribute. Enter a value for the id, TypeTest, Version, Result, Labels, Branch, Test path, and Text attributes. For the other attributes, select a value in the drop-down list.

Example

Select Fail.

- d. Select either the **AND** or the **OR** operator in the first field to add a condition to compare the first rule with another rule.
- e. Select Add rule in the drop-down list.

f. Select an attribute, a condition, and select or enter a value.

Example

Select **Test** as an attribute, select **=** as a condition operator, and enter *mytest* as a value.

Follow these steps to add a group in your query:

3. Select Add group in the drop-down list.

Note: A group is a collection of rules and can also contain other groups within a query. You can add a rule or a group within this group.

4. Select a condition operator.

Example

Select Or.

- 5. Select Add rule in the drop-down list to add a rule in the group.
- 6. Select the required an attribute, an operator, and enter a value for the rule.

Example

Select the **Type** attribute, **=** as an operator, and **Compound Test** as a value.

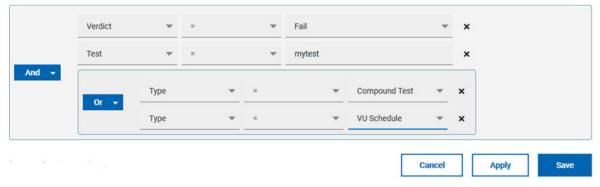

- 7. Select **Add rule** to add another rule in the group.
- 8. Select and enter the appropriate parameters as you did for the other rules.

Example

Select **Type** as an attribute, **=** as a condition, and **VU Schedule** as a value.

9. Click **Apply** if you want to apply the filter now.

You can cancel the query or save the query when the results are found.

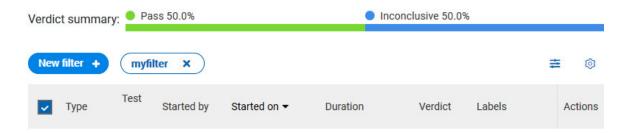

10. Click Save.

Proceed as follows to select your filters:

11. Enter a name for the filter and save in the dialog box that is displayed.

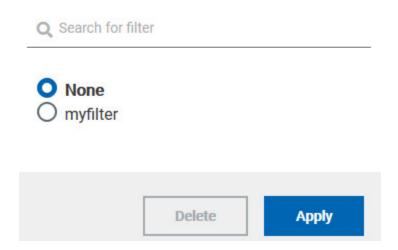

Result

The filter is displayed as a favorite filter.

12. Click the icon \rightleftharpoons to select the filters you created from the list of saved filters.

Filters

13. Click a filter in the list of saved filters. If a filter does not display in the list, enter the name of a filter in the search field and select it.

Note: You can delete a filter from the list or disable filters by selecting none in the list.

14. Apply the selected filter.

Result

The filter is displayed as a new favorite filter in the **Results** page.

Comparing test reports

After you run performance tests, you can analyze the difference between two or multiple test results in IBM® Rational® Test Automation Server. For example, you can compare the performance of an application at different time slots or different milestone builds between two test results.

About this task

You can compare the test runs for performance tests that are in the same project or in different projects.

- 1. Select results in the **Results** page by checking the boxes in the first column.
- 2. Click the icon

Note: When comparing multiple runs, you cannot compare multiple time-ranges or stages.

Result

The two or multiple test results are displayed in a browser window in the same report.

Viewing trending reports

When the performance test runs are complete, you can view the trend of response time for an application over a period of time in IBM® Rational® Test Automation Server from trending reports. In addition to the response time, you can view the trend for the loops, transactions, and performance requirements for the application.

About this task

The trending reports are available for performance tests only.

- 1. Select results in the first column in the Results page.
- 2. Click the icon to view the trending reports.

Note: When comparing multiple runs, you cannot compare multiple time-ranges or stages.

Results

You can analyze the trend information for multiple test results in the same report from a browser window.

Re-executing tests from results

You can re-execute a test, a schedule, a collection of tests or schedules from IBM® Rational® Test Automation Server if you want to keep the same commit id.

Before you begin

You must have executed a test or multiple tests from the Execution page in IBM® Rational® Test Automation Server.

Re-executing a test from the **Results** view requires a Tester or an Owner role.

About this task

The following procedure describes how to re-execute a single test or multiple tests at a time.

Perform all the following steps from the Results page.

- Proceed as follows to re-execute one test at a time:
 - Identify the test that you want to re-execute and click the Re-execute button in the Actions column.
 Result

The **Execute test asset** dialog box displays the same parameters as the ones that were set to execute the initial test from the **Execution** page.

2. Select another Version of the test.

Note: If you select another version of the test, the settings configured in the dialog box and in the **Environment, Data Sources** and **Locations** tabs might change.

3. Modify the **Schedule** parameters.

Note: If you don't want to execute the test now, schedule the time when you want the test to be

- Click the Environment tab and select another API test environment if multiple environments were initially set for a test that is running an API Suite.
- 5. Click the **Data Sources** tab and select an override option if multiple data sources were defined for the initial test run.
- 6. Click the **Variables** tab and add a new variable if you want to re-execute a test asset with a different variable from the one configured in the asset.
- 7. Click the **Location** tab to override the default cluster location if the test asset has a docker host or static agents configured.
- 8. Click **Advanced** to modify the advanced parameters that were set for the initial test run.
- 9. Enter a new **Program Argument** if applicable to the test.

Note: If Jaeger is installed with IBM® Rational® Test Automation Server, you can enter the -history jaeger Program Argument to produce Jaeger traces when you run the tests.

- 10. Enter a new instance of **Java arguments** if applicable to the test.
- 11. Enter the environment variables that must be passed to the test run at runtime in the **Environment Variables** field.
- 12. In the **Resource Monitoring** tab, click the + and press the Ctrl + Space keys, or enter the initial letter of a label to select a label in the list and override the current sources in the schedule.

Note: The **Resource Monitoring** tab is displayed for performance schedules and only if you have enabled the **Resource Monitoring from Service** option from Rational® Performance Tester.

The label field is grayed if you don't have any label entered in your current project. To collect data during the test execution, you must first enter labels in the Resource Monitoring sources page from IBM® Rational® Test Automation Server.

For more details about controlling Resource Monitoring sources and labels, see the links at the end of this page.

- 13. Click the **Re-execute** icon to re-execute the test now or at a scheduled time.
- · Proceed as follows to re-execute multiple tests at a time:
 - 1. Click the checkboxes for the tests that you want to re-execute.

You can select them one by one or select all of them.

Result

A toolbar is displayed.

2. Click the **Re-execute** icon in the toolbar.

Result

A message indicates the number of selected tests and the number of tests to be re-executed. The tests are re-executed with the same initial commit ids and parameters.

3. Click Execute.

Result

You can view the results, logs, and reports of the re-executed tests in the Results page.

Controlling Resource Monitoring sources in a schedule

Tests configurations and test runs

Resource Monitoring service

When you apply load to a system under test, the amount of resources consumed by your system is increasing. If the capacity of the resources does not match the load, you can see performance issues in the results. The Resource Monitoring service in Rational® Test Automation Server helps you monitoring the resources of a system and establish the performance metrics of the system. Thus, you can observe the health of these resources while a schedule is running.

You can use the Resource Monitoring service while running a schedule to capture data, such as processor or memory usage, or to monitor the availability of hosts and services by using counters. The Resource Monitoring service can provide a comprehensive view of a system under test to help determine problems. Hosts and services can be servers, virtual machines, or any local host or network services. You can also monitor remote hosts and services with agents.

Monitoring local host and service

You can use the Resource Monitoring service to monitor any local host and network service. In this case, the resources of the hosts are locally monitored. This method is used for host targets that the service can reach directly. With Rational® Test Automation Server, you can also monitor performance metrics that are collected and stored by a monitoring system that is monitoring a host. You can use Prometheus server or a data collector through an exporter, OpenMetrics exporter, for example.

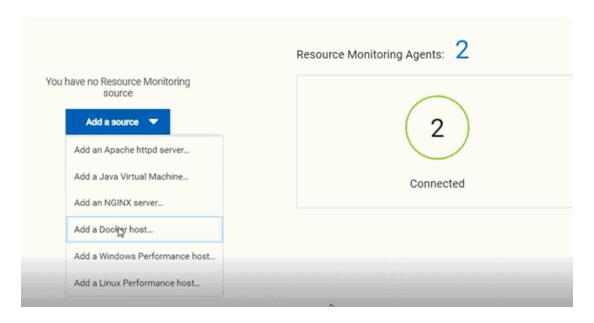

To monitor resources on a local system, you must add the source of the resource monitoring data from the Resource Monitoring page. Then you have to enter some connection settings and select the performance counters to monitor the sources. The metrics are exposed in a graph for each selected counter.

Monitoring remote host with monitoring agents

You can use the Resource Monitoring service to monitor remote hosts and services with agents through wider sets of data collectors, computers, and networks. The purpose is to capture CPU load, disk space, memory, and the running process for example.

Agents are closer to the target that you want to monitor. You can set up the agent on an authorized host, for example, when access to an **Apache httpd** or **NGINX** server status page or to a **JVM** JMX port is restricted to one or few client hosts only. The configuration task is simplified, and no security changes are required.

To monitor a host across monitoring agents, you must first set up the Resource Monitoring agents on the target host for which you want to collect the performance statistics. The agents establish a connection with the Resource Monitoring service. When the connection is set, the agent is showing up in the list of sources in the Resource Monitoring main page. You can select it, choose performance counters, and view the metrics statistics in a graph for each selected counter.

Resource Monitoring sources

With Rational® Test Automation Server, you can monitor resources for the following sources:

- · Apache httpd server
- NGINX and NGINX Plus
- Java Virtual Machine: You can monitor JVM resources from a local or from a remote system.
 Some parameters must be set in the command before running the Java Virtual Machine. For more details, see the link to the page about starting a Java Virtual Machine on this page.
- Windows Performance host: To monitor the performance of a Windows host, you must have installed an agent on the target Windows host.

If IBM® Rational® Test Automation Server is installed on a Linux system, and you want to check the performance of the Windows host, you must have installed an agent on the target Windows host to start monitoring its performance.

 Linux Performance host: To monitor the performance of a Linux host, you must have installed an agent on the target Linux host.

If IBM® Rational® Test Automation Server is installed on a Windows system and you want to check the performance of the Linux host, you must have installed the Resource Monitoring agent on the Linux system.

- Docker host: A Resource Monitoring agent is mandatory to get a Docker Data Collector. The
 Docker host source is added to the list of resource monitoring sources when the agent is
 installed.
- Prometheus server: You can monitor metrics of a host under test that are collected by a
 Prometheus server. Prometheus collects metrics from monitored targets by regularly requesting
 appropriate HTTP endpoints on these targets (called scraping).

The metrics data are collected through data collectors sets (groups of performance counters) that are tracking the system performance. The performance data results are stored under a Prometheus REST API so that they can be consumed by external systems.

With the Resource Monitoring service in Rational® Test Automation Server, you can query these performance metrics collected by Prometheus servers. 'PromQL' is the language for querying Prometheus metric data.

In the Resource Monitoring service, you can select default queries, or create additional ones.

A Prometheus server is required and it must be configured to scrap a set of exporters, every 15 seconds by default. Pushgateway, service discovery, and Alertmanager are optional.

• OpenMetrics exporter:

You can monitor the metrics of a host under test that are collected and exposed through an OpenMetrics format or a Prometheus exporter format.

The Resource Monitoring service in Rational® Test Automation Server is given the ability to scrap metrics exposed by an OpenMetrics or Prometheus exporter through metric counters. No Prometheus server installation is required, you only need to set up one or multiple OpenMetrics, or Prometheus exporters that fit your software or host target. Refer to the link at the end of this page to see the list of exporters.

Click the links in the next section of this page for more details on the Resource Monitoring tasks that you can perform in Rational® Test Automation Server.

Exporters and Integrations

Starting a Java Virtual Machine on page 303

Resource monitoring capabilities

With Rational® Test Automation Server, you can monitor a host or a service that you add to a project as a source. You can select the statistics counters that are used to collect metrics and the resource usage data throughout the monitoring system. You can visualize metrics and data that are gathered during the monitoring process in Rational® Test Automation Server.

Requirements:

- You must be a Team Space Owner to create, modify and remove resource monitoring sources in a team space. Any team space Member (not owner) can only view resource monitoring sources.
- You must be a project *Owner* to create, modify and remove resource monitoring sources in a project. Any project *Member* (not the owner) can only view resource monitoring sources.

Supported sources

With IBM® Rational® Test Automation Server, you can monitor resources for the following sources:

- Apache httpd server: You can optionally use agents.
- NGINX and NGINX Plus: You can optionally use agents.
- · Java Virtual Machine: You can optionally use agents.

You can monitor JVM resources from a local or a remote system. Some parameters must be set in the command before running the Java Virtual Machine. For more details, see the link to the page about starting a Java Virtual Machine on this page.

Windows Performance host:

To monitor the performance of a Windows host, you must have installed an agent on the target Windows host

or on a Windows host that is configured to access the performance data of the Windows host target.

Linux Performance host:

To monitor the performance of a Linux host, you must have installed an agent on the target Linux host.

Docker host:

A resource monitoring agent is mandatory to get a Docker data collector. The Docker host source is added to the list of resource monitoring data collectors when the agent is installed.

· Prometheus server:

You can monitor metrics of a host under test that are collected by a Prometheus server. Prometheus collects metrics from monitored targets by regularly requesting appropriate HTTP endpoints on these targets (called *scraping*).

The metrics data are collected through data collectors sets (groups of monitoring counters) that are tracking the system performance. The performance data results are stored in the Prometheus database so that they can be consumed by external systems through a REST API.

In Rational® Test Automation Server, you can query these performance metrics collected by Prometheus servers. 'PromQL' is the language for querying Prometheus metric data. Refer to Prometheus PromQL documentation for information about this query language.

You can select default queries, or create additional ones.

A Prometheus server is required. It must be configured to scrap a set of exporters, every 15 seconds by default. Pushgateway, service discovery, and Alertmanager are optional.

If Rational® Test Automation Server cannot directly reach the Prometheus server, you can consider setting up an agent on an authorized host or on the same host that is running Prometheus.

· OpenMetrics exporter:

You can monitor the metrics of a host under test that are collected and exposed through an OpenMetrics format or a Prometheus exporter format.

Rational® Test Automation Server can scrap metrics exposed by an OpenMetrics or Prometheus exporter through metric counters. No Prometheus server installation is required, you only need to set up one or multiple OpenMetrics, or Prometheus exporters that fit your software or host target.

If Rational® Test Automation Server cannot directly reach the Prometheus server, you can consider setting up an agent on an authorized host or on the same host that is running Prometheus.

Monitoring host resources

To monitor host resources, you must add the monitoring sources to the Resource Monitoring service, enter connection settings and select performance counters that are used to capture the performance statistics.

Before you begin

You must be logged in Rational® Test Automation Server and be the owner of an existing new project.

If you monitor a remote host, it must be connected with the computer that you use to access Resource Monitoring service. See Installing Resource Monitoring agents on remote hosts on page 295.

About this task

This task applies to NGINX and NGINX Plus, Apache httpd server, Java Virtual Machine, Windows Performance host, Linux Performance host, and Docker host sources.

- 1. In the Resource Monitoring page, click Add a source, for example: Add an NGINX server.
- 2. In the New server dialog box, fill in the following connection settings:
 - a. In **Target host**, enter the IP address or host name and port number of the host where the server to monitor is installed.
 - b. In Server edition, select the appropriate server from the drop-down list.
 - c. In Path to the status page of the server, enter the name of the page to view the status of the server.

If you select NGINX Plus (with API version 3) as a source, you must specify the name of the path to view the API root of the NGINX Plus server.

d. In Security, select the following options:

Secured with TLS/SSL

If the application server is secured with TLS/SSL.

Trust self-signed certificate

To accept the server certificate.

Do not verify host name

To ignore verification of the host name in the certificate.

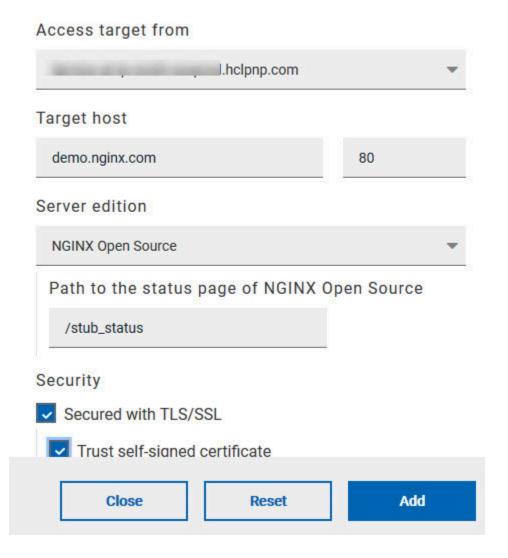

Require credentials

If the server requires log-in credentials, enter a User name and Password.

Note: For remote hosts that are already connected to Rational® Test Automation Server through an agent, you have only the **Access target from** field enabled.

New NGINX server

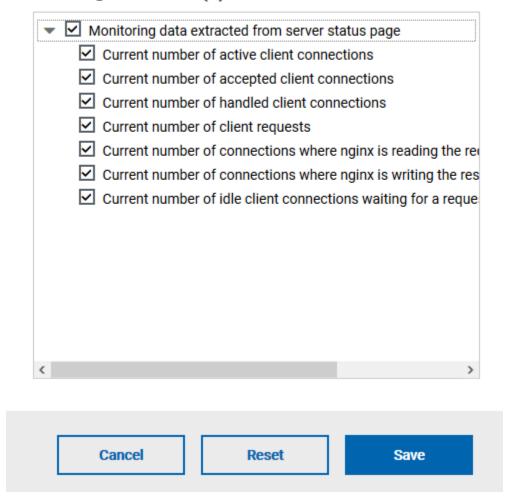

- e. Click Add.
- 3. Select and save the resource counters to monitor. You can select them from the list where they follow the server logical organization.

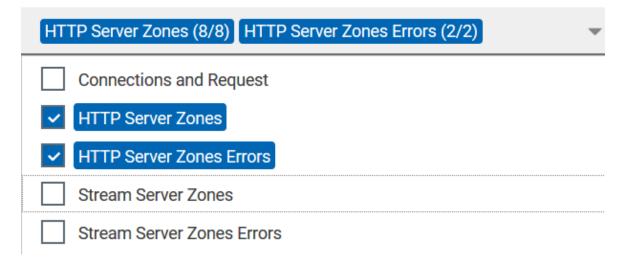

×

Choose Data Counters

Choose the data to be collected from NGINX demo.nginx.com:80 (3)

For a faster selection, select the counters from the built-in sets drop-down list where they are organized by theme and save your selection.

For Docker host, you can select different sets of counters.

- The first level of counters: Generic counters that are related to a Docker Image and all its running Docker Containers (in an exit, running or paused, created, restarted, removing, dead or transitive state).
- The second level of counters: Specific counters that are related to the existing Docker Containers.

Result

When the selected counters are saved, two tables are displayed in the resource monitoring main page. They contain the total number of sources you have added and the number of sources ordered by type.

What to do next

You can click the links in the tables to view the performance metrics of your monitored system.

Monitoring metrics collected by a Prometheus server

You can monitor your system resources by using metrics data that are collected by a Prometheus server while executing a schedule.

Before you begin

You must have created a project in Rational® Test Automation Server.

You must have installed and configured a Prometheus server.

Read the concept information about Resource Monitoring and monitoring Prometheus server source. See Resource Monitoring service on page 277

About this task

The following procedure describes how to select and create Prometheus queries in Rational® Test Automation Server. You must set a connection between Rational® Test Automation Server and the Prometheus server first to access to the Prometheus queries.

Enter the connection settings, then select queries.

- 1. Click Add a source and select Add a Prometheus Server.
- 2. Enter the connection settings in the New server dialog box,.
 - a. In **Target host**, enter the IP address or host name and port number of the host where the Prometheus server is installed.
 - b. Enter the **Path to the API root of Prometheus** to point to the Prometheus API where the monitoring data are saved.
 - c. Enter the security parameters if required. For information about this section, see related links.
 - d. Click **Add** to close the dialog box.

Result

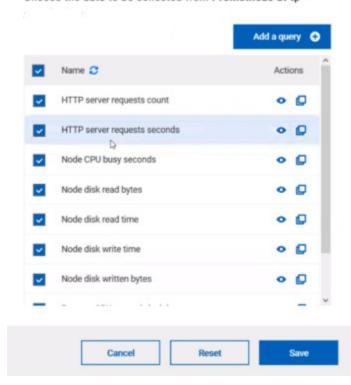

The Prometheus server source is created successfully in the background and a dialog box opens to select the Prometheus data queries.

3. In the **Select Prometheus queries** dialog box, select queries that are available in the list to collect Prometheus metrics data by clicking the checkboxes.

You can reset the selection.

Select Prometheus queries

Choose the data to be collected from Prometheus at tp-

- 4. Follow these steps to create a query:
 - a. Click Add a query.
 - b. Enter a name for the new query in the Create a Prometheus query dialog box.
 - c. Enter a PromQL query.any keyword and press Ctrl+Space in the **Type and test your PromQL query**.

 Result

All the possible combinations of keywords and metrics related to your searched keyword are listed.

Type and test your PromQL query (i) abs() function absent() function and keyword avg keyword

avg over time() function

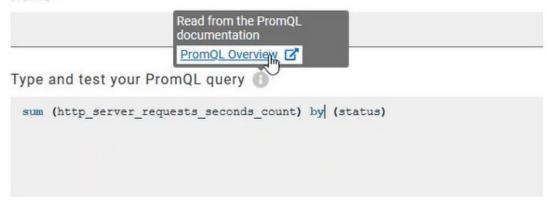

d. Select a query in the list.

bool keyword bottomk keyword

by keyword

e. Click the link that points to the 'Querying Prometheus documentation' page in the information tool tip to find other examples of queries in a web page that you can use as samples.

Name

f. Click Test query.

If the test is successful, a green check is displayed, otherwise you get a red check with an error message.

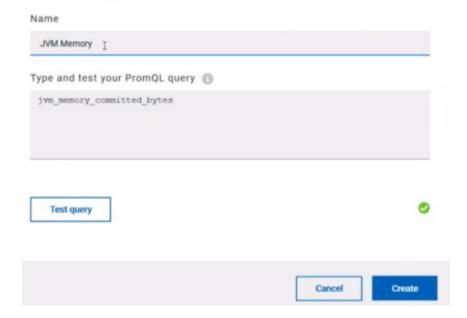

- g. Click Create.
- 5. Proceed as follows to duplicate a query:
 - a. Click the **Duplicate** icon to duplicate a standard query.
 - b. Rename the duplicated query in the **View the Prometheus query** dialog box. Make sure that the name you give to the query is not already used.
 - c. Modify the query type.

- d. Test the query .
- e. Click Create.

Note: You can click Create or Duplicate only if the test of the query is successful and the name of the query is not already in use.

Create a Prometheus query

- 6. Proceed as follows to modify a query:
 - a. Click the **Modify** icon .
 - b. Modify the name and type of the query.
 - c. Test the query.
 - d. Click Update.
 - e. Delete duplicated or created queries.
 - f. Click Save to close the Select Prometheus queries dialog box.
- 7. Click Save and close the **Select Prometheus queries** dialog box.

Results

The Resource Monitoring page displays the total number of sources you have added to your project and the number of sources ordered by type in cards.

What to do next

Click the links in the cards to go to the sources page and see the performance metrics for each source you added to your project. For more details, see Viewing the performance metrics

Monitoring metrics exposed by an OpenMetrics exporter

With Rational® Test Automation Server, you can monitor your system resources by using metrics data that are exposed by an OpenMetrics or a Prometheus exporter through metric counters while executing a schedule.

Before you begin

You must have at least one exporter or software to expose monitoring metrics with an OpenMetrics or Prometheus format.

You must have created a project in Rational® Test Automation Server.

About this task

The following procedure describes how to select and create OpenMetrics counters in Rational® Test Automation Server. You must set a connection between Rational® Test Automation Server and the OpenMetrics exporter to select counters.

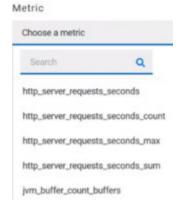

- 1. Click Add a source and select Add an OpenMetrics exporter.
- 2. In the **New OpenMetrics exporter** dialog box that opens, enter the OpenMetrics exporter details to access its exposition endpoint as follows:
 - a. In **Target host**, enter the IP address or host name and port number of the host where the server is installed.
 - b. Enter the Path to the exposition endpoint to point to the application where the data performance results must be stored. As the path depends on the type of exporter used, refer to the exporter's documentation and configuration to indicate the right path.
 - c. In **Security**, enter the security parameters if required.
 - d. Click Add to close the dialog box.

Result

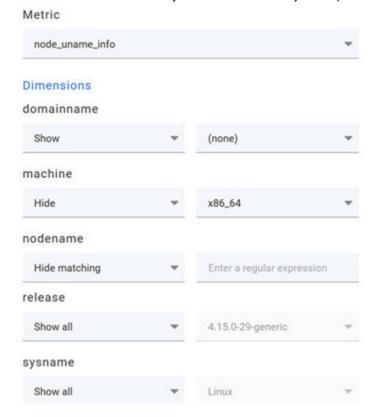

The source is created successfully in the background. A dialog box opens to select the OpenMetrics counters.

- 3. Click the checkboxes to select counters in the Select OpenMetrics counters dialog box.
- 4. Follow these steps to create a counter:

- a. Click Add a counter.
- b. Enter a name for the new counter, in the **OpenMetrics counter**.
- c. Select metrics in the drop-down list or enter a keyword in the **Dimensions** field to enable the dynamic input help. You can also use the search field that appears in the list of metrics.

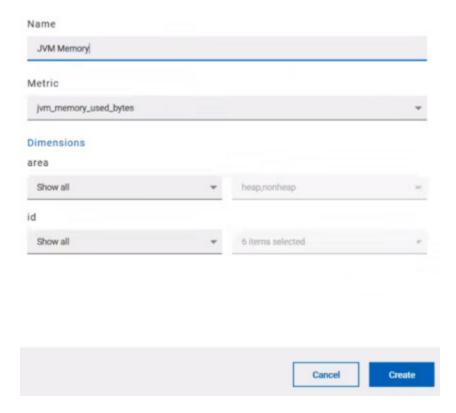

d. Select **Dimensions** from the dynamic fields when they are required.

- e. Select the appropriate OpenMetrics counter that you are looking for.
- f. Click Create.

Create an OpenMetrics counter

- 5. Follow these steps to duplicate a counter:
 - a. Select a counter in the list, and click the **Duplicate** icon
 - b. Modify the name of the counter and the Dimensions.
 - c. Click Create.
- 6. Proceed as follows to modify a new counter:
 - a. Click the Modify icon.
 - b. Modify the name, Metrics, and Dimensions of the counter in the Modify the OpenMetrics counter.
 - c. Click Update.

Note: You can create, duplicate, or update a counter only if the name of the counter is not already used.

7. Click Save and close the Select OpenMetrics counters dialog box.

Note: You can delete counters, but only the ones that you created or duplicated.

Results

The Resource Monitoring page displays the total number of sources you have added to your project and the number of sources ordered by type in cards.

What to do next

Click the links in the cards to go to the sources page and see the performance metrics for each source you added to your project. For more details, see Viewing the performance metrics.

Resource Monitoring service on page 277

Resource Monitoring agents

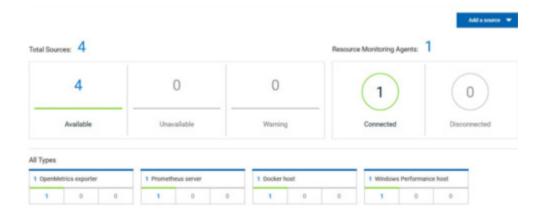

You can connect agents to the Resource Monitoring service from other hosts to monitor a larger set of data collectors, computers, servers, or systems, or if a server to monitor requires authorization access. To monitor these remote servers, you must configure and run the agents so that a connection is set between IBM® Rational® Test Automation Server Resource Monitoring service and the agents.

For testing, you would need many hosts. For example, you might have one host with the application server, another host with the database server, and some hosts to apply the user load. Due to network or firewall issues, sometimes, it becomes difficult for multiple hosts to connect to each other. Resource Monitoring agents are installed on the target hosts so that they can establish a connection with IBM® Rational® Test Automation Server to gather resource statistics of the target host.

The agents always try to connect with the server through the HTTPS protocol. You must install the agent and start it. From the Resource Monitoring service page in IBM® Rational® Test Automation Server, you can copy the command lines to download files and to run the agents. When you stop the agent, the monitoring sources that you have already added persist but the live data will not be available.

You can configure your Resource Monitoring agent as a service so that the agent automatically runs when the host is restarted. For details, see the documentation pages about starting Resource Monitoring agents on Windows or Linux.

When the agent is connected to IBM® Rational® Test Automation Server, it is added to the main page of the Resource Monitoring service.

To monitor your host across the agent, you must add the agent as a monitoring source and select performance counters to monitor as described in Monitoring host resources help page.

Monitoring host resources on page 282

Starting a Resource Monitoring agent as a service on Windows on page 297

Starting a Resource Monitoring agent as a service on Linux on page 300

Installing Resource Monitoring agents on remote hosts

You must install the Resource Monitoring agents on the target host for which you want to monitor the performance statistics. You need to run the agents to establish a connection with the Resource Monitoring service.

Before you begin

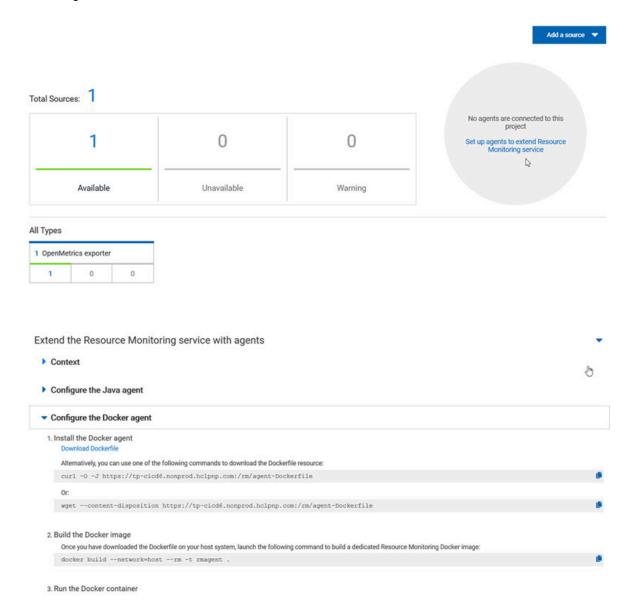

- The Resource Monitoring service does not require access to the agent host but the agent must have reached the service host over HTTPS.
- The Java agent must have been launched from a jar file and requires a Java 8 virtual machine.
- The Docker agent must have been launched in a Docker container and requires Docker 19.03.

About this task

This task applies to Java and Docker agents. However, the commands used to install agents are different from Java and Docker agents. You can find the commands and instructions in IBM® Rational® Test Automation Server in the Resource Monitoring agents page.

Before you start the Docker agents, you must build a Docker image.

1. Click **Set up Agents to extend Resource Monitoring service** link in IBM® Rational® Test Automation Server to access the agents page where you can find the instructions and commands that are to be used to install and run the agents.

2. Expand Configure the Java agent and click Download jar file to download the Java agent, or expand Configure the Docker agent and click Download Docker file to download a Docker agent.

You can also use the *curl* and *wget* commands to download the agent without accessing the Resource Monitoring web UI. For more facility, use the code snippets to copy and fill in the commands with the valid offline token and the jar or docker file name.

```
curl -0 -J https://hostName/rm/Agent-jar
wget --content-disposition https://hostName/rm/Agent-jar
```

3. Copy the build command that is under **Build the Docker image**, paste it in your console and run it to build a Resource Monitoring Docker image.

docker build --network=host --rm -t rmagent

Note: This step applies to Docker agents only.

- 4. Configure the command as follows to run your agent:
 - a. Copy the appropriate command for Windows or Linux with the code snippets.
 - b. Enter the path to the directory that contains the agent .jar file, and paste the command.

Example

On Windows:

```
set RTCP_OFFLINE_TOKEN=(Enter your offline token here)
java -jar (Enter the name of the downloaded jar file here) --ServiceUrl=https://hostName/rm
--projectId=<project_id>
```

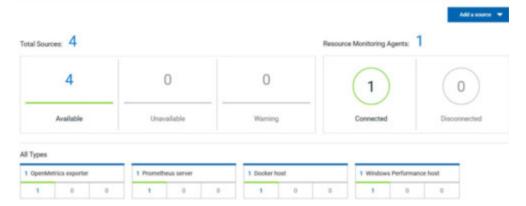

Example

On Linux:

```
sudo RTCP_OFFLINE_TOKEN=(Enter your offline token here) java -jar (Enter the name of the
downloaded jar file here) --ServiceUrl=portNumber/rm --projectId=ctId=ctroin=100
```

Results

When the agent is started, the agent is connected to IBM® Rational® Test Automation Server. The agent is displayed in the list of connected Resource Monitoring agents with the host name and status of the agent. The agent is also added to the main page of the Resource Monitoring service in IBM® Rational® Test Automation Server.

What to do next

You can add a new Resource Monitoring source. It can be collected from a service or from the named agents, depending on the capabilities supported by the environment.

Starting a Resource Monitoring agent as a service on Windows

To ensure that the Resource Monitoring agent starts by itself when the host is running, you can set up the environment in such a way that the Resource Monitoring agent can be started as a service.

Before you begin

You must have completed the following tasks:

- Installed Java 8 on the host.
- Added IBM® Rational® Test Automation Server to the PATH environment variable.
- Created an offline token to connect the agent securely with appropriate permissions.

Note: You can create an offline token from the User menu of the Resource Monitoring page or you can re-use your active offline token. The token expires if it is not used for a month.

To allow remote access to the performance data on Windows 10, you must have considered the following information:

- The user name and password are the same on the local and remote servers. Otherwise you must have provided remote server credentials.
- The remote user must be a member of the Performance Monitor Users group (start lusrmgr.msc and add the user to this group).
- The Remote Registry service must be running on the remote host (start services.msc) and must have verified the Remote Registry status).
- File and printer sharing must be enabled on the Network Interface of the remote host that is implied in the communication with the local host.
- You must have activated the following Windows Firewall rules so that the remote firewall does not block the access:
 - File and Printer Sharing (NB-Name-In)
 - File and Printer Sharing (NB-Session-In)
 - File and Printer Sharing (*)
- 1. Download the latest release of winsw.

You can choose to download WinSW.Net2.exe or WinSW.Net4.exe depending on the version of .Net framework that you already have on the host Windows.

- 2. Create a folder on your local hard drive like RMAgent-winservice.
- 3. Copy the downloaded executable to this new folder and rename the file to RMAgent-winservice.exe.
- 4. Create a new text file in the same folder and name it ${\tt RMAgent-winservice.xml}$.
- 5. Copy and adapt the following content to this new RMAgent-winservice.xml file to set up the offline token:

- Replace <service-host> by the host name of the host that runs IBM® Rational® Test Automation Server.
- Replace <project-id> which is the number that you find after /projects/ in the browser's URL when you browse to this project.
- 6. Create a new text file in the same folder and name it auto-upgrade.bat.
- 7. Copy the following content to this new file to upgrade the agent .jar file automatically:

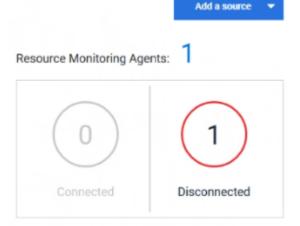

```
@echo off
for /f "tokens=*" %%a in ('dir /b /od %BASE%\com.ibm.test.rm.agent-*.jar') do set newest=%%a
%BASE%\RMAgent-winservice.exe stop
del %BASE%\RMAgent.jar
mklink %BASE%\RMAgent.jar %BASE%\%newest%
%BASE%\RMAgent-winservice.exe start
```

- 8. Start the command prompt as an administrator and change the directory to the newly created directory: RMAgent-winservice.
- 9. Download the agent .jar file that is available from the agents page in the Resource Monitoring service, under the **Extend the Resource Monitoring service with agents** section and save it to the same directory.
- 10. Enter the following command in the command prompt to create a symbolic link named RMAgent.jar to the agent jar file:

```
mklink RMAgent.jar com.ibm.rm.agent-<version-and-datetime>.jar
```

11. Enter the following commands:

Resource Monitoring Agents: 1 Connected Disconnected

In the Services Windows application, you can check whether the service is up and running. You can see in the Resource Monitoring page whether the Resource Monitoring agent is disconnected or connected.

The Resource Monitoring agents write the logs to the same folder in files named RMAgent-winservice.out.log, RMAgent-winservice.err.log and RMAgent-winservice.wrapper.log. If the Windows service for the agent is not started or if it is not connected to the Resource Monitoring service, verify the log files.

Results

The Windows agent is added to the main page of the Resource Monitoring service in IBM® Rational® Test Automation Server.

What to do next

You can monitor the Windows agent by selecting counters. See Monitoring host resources on page 282.

winsw file

Starting a Resource Monitoring agent as a service on Linux

To ensure that the Resource Monitoring agent starts by itself when the host is restarted, you can set up the environment in such a way that the Resource Monitoring agent can be started as a service.

Before you begin

You must have completed the following tasks:

- · Installed Java 8 on the host.
- Added IBM® Rational® Test Automation Server to the PATH environment variable.
- Created an offline token to connect the agent securely with appropriate permissions.

Note: You can create an offline token from the User menu of the Resource Monitoring page or you can re-use your active offline token. The token expires if it is not used for a month.

About this task

This topic relies on systemd services that are the default on most modern Linux distributions. Other ways mi require adaptations of the instructions but the provided script will be a good basis in most cases.

- 1. Create a folder on your local hard drive like /opt/RMAgent-linuxservice.
- 2. Download the agent .jar file that is available from the Agents page in the Resource Monitoring service, below the **Extend the Resource Monitoring service with agents** section and save it to the same directory.
- 3. Create a new file /etc/systemd/system/RMAgent-linuxservice.service.
- 4. Add the following content to this new file:

```
[Unit]
Description = Resource Monitoring Agent
After = network.target

[Service]
Type = forking
ExecStart = /opt/RMAgent-linuxservice/RMAgent-linuxservice.sh start
ExecStop = /opt/RMAgent-linuxservice/RMAgent-linuxservice.sh stop
Restart = on-failure
RestartSec = 10

[Install]
WantedBy = multi-user.target
```

5. Create another file /opt/RMAgent-linuxservice/RMAgent-linuxservice.sh.

```
#!/bin/sh

# Update the 3 following variables with the Server's host name, project id and offline token:
SERVICE_URL=https://<hostname>/rm
PROJECT_ID=<project-id>
export RTCP_OFFLINE_TOKEN=<offline-token>

ARGS="--serviceUrl=$SERVICE_URL --projectId=$PROJECT_ID --autoUpgradeDownloadThen=exitFailure"

SCRIPT=$(readlink -f "$0")
RMAGENT_HOME=$(dirname "$SCRIPT")

# Ensure we're using the latest downloaded jar file
PATH_TO_JAR=`ls -t $RMAGENT_HOME/com.hcl.test.rm.agent-*.jar | head -1`
if [ -z "$PATH_TO_JAR" ]
then
    cd $RMAGENT_HOME && { curl -k -0 -J $SERVICE_URL/agent-jar; cd -; }
PATH_TO_JAR=`ls -t $RMAGENT_HOME/com.hcl.test.rm.agent-*.jar | head -1`
```

```
if [ -z "$PATH_TO_JAR" ]
 then
   echo "Start the server at $SERVICE_URL to allow download of the latest agent jar file"
   echo "Exiting..."
   exit 1
  fi
fi
SERVICE_NAME="Resource Monitoring Agent"
#Pid file will reside in this script's folder
PATH_TO_PID=$RMAGENT_HOME/RMAgent-pid
#Log file will reside in this script's folder
PATH_TO_LOG=$RMAGENT_HOME/RMAgent.log
case $1 in
   start)
        echo "Starting $SERVICE_NAME ..."
        if [ ! -f $PATH_TO_PID ]; then
            nohup java -jar $PATH_TO_JAR $ARGS >> $PATH_TO_LOG 2>&1 &
                        echo $! > $PATH_TO_PID
            echo "$SERVICE_NAME started ..."
            echo "$SERVICE_NAME is already running ..."
    ;;
    stop)
        if [ -f $PATH_TO_PID ]; then
            PID=$(cat $PATH_TO_PID);
            echo "$SERVICE_NAME stopping ..."
            kill $PID;
            echo "$SERVICE_NAME stopped ..."
            rm $PATH_TO_PID
        else
            echo "$SERVICE_NAME is not running ..."
        fi
    ;;
    restart)
        if [ -f $PATH_TO_PID ]; then
            PID=$(cat $PATH_TO_PID);
            echo "$SERVICE_NAME stopping ...";
            kill $PID;
            echo "$SERVICE_NAME stopped ...";
            rm $PATH_TO_PID
            echo "$SERVICE_NAME starting ..."
            nohup java -jar $PATH_TO_JAR $ARGS >> $PATH_TO_LOG 2>&1 &
                        echo $! > $PATH_TO_PID
            echo "$SERVICE_NAME started ..."
        else
            echo "$SERVICE_NAME is not running ..."
        fi
    ;;
esac
```

Notes:

- Replace <service-hostname> by the host name of the host that runs IBM® Rational® Test
 Automation Server.
- Replace <project-id> which is the number you'll find after /projects/ in the browser's URL when browsing to this project.

Results

The Resource Monitoring agent starts automatically when the host restarts. The Linux agent is added to the main page of the Resource Monitoring service in IBM® Rational® Test Automation Server.

What to do next

You can monitor the Linux Performance host source by adding counters. See Monitoring host resources on page 282.

systemd services

Starting a Java Virtual Machine

To monitor the Resource Monitoring data from a Java Virtual Machine (JVM), you must first start the JVM. You must enter the IP address of the JVM, the IP port, and the security parameters in the command before running the Java Virtual Machine.

- 1. Enter The IP address of the JVM (local or remote host) and the IP port in the command that is used to run the Java Virtual Machine.
- Optional: You can use the authentication security data to start the virtual machine. In this case, you must enter the name of the password file. You can also enter the name of an access file that might be needed if user privileges are required.

Exemple

Parameters used to launch a JVM without security:

```
java
-Dcom.sun.management.jmxremote
-Dcom.sun.management.jmxremote.port=9010
-Dcom.sun.management.jmxremote.local.only=false
-Dcom.sun.management.jmxremote.authenticate=false
-Dcom.sun.management.jmxremote.ssl=false
-jar MyapplicationFile.jar
```

Parameters used to launch a JVM with authentication security:

```
java
-Dcom.sun.management.jmxremote
-Dcom.sun.management.jmxremote.port=9010
-Dcom.sun.management.jmxremote.local.only=false
-Dcom.sun.management.jmxremote.authenticate=true
-Dcom.sun.management.jmxremote.ssl=false
```

- -Dcom.sun.management.jmxremote.password.file=jmxremote.password
- -Dcom.sun.management.jmxremote.access.file=jmxremote.access (this command is optional)
- -jar MyapplicationFile.jar

Configuration of a change management system

When you use any application to create and track defects (bugs), issues, or other work items, you can configure the application as a change management system on Rational® Test Automation Server. You can then create defects (bugs), issues, or other work items without the need to open your application.

You use Rational® Test Automation Server to run tests for the software that you develop and view their results. When you discover that you might want to raise defects (bugs), issues, or other types of work items for these tests, you are required to open the application that you use. You can only then, create defects (bugs), issues, or other work items in your application.

When you configure your application as a change management system on Rational® Test Automation Server, you can create defects (bugs), issues, or other work items without the need to open your application.

You can find details in the following table about the usage of the applications that you can configure as a change management system on Rational® Test Automation Server:

Issue track- ing application	Usage as a change management system	Go to
Atlassian Jira	You can create stories, defects, or tasks as	Configuration of Jira as a change management
Software	issues in your project in Jira from Rational®	system on page 304
	Test Automation Server and also launch your	
	project in Jira from Rational® Test Automation	
	Server to track and manage these issues.	

Configuration of Jira as a change management system

You can integrate Rational® Test Automation Server with Jira to manage and create defects after the test run is complete.

You can create multiple defects for a test result from the **Results** page of Rational® Test Automation Server, if required. After you create a defect, you can track the defect from the **Change Management System** card on the **Results** page.

When you do not configure the Jira server in your project and if you click the **Open action menu** icon from the **Actions** column in the **Results** page, the following message is displayed:

The change management system is not configured for the project. You must contact your project owner to configure Jira for the project. If you are a project owner click here.

If you are a project *Owner*, you can click the link provided in the message to open the **CHANGE MANAGEMENT SYSTEM** tab. You can then configure the Jira server for your project.

The following topics provide more details about integrating Rational® Test Automation Server with Jira and creating defects.

Task flow for integrating Jira

You must perform these tasks in sequence as listed in the following table. The table also provides you the links to the information about the tasks.

	Tasks	More information
1	Install IBM® Rational® Test Automation Server.	Installation of the server software on page 25
2	Create the type of tests that are supported for running on Rational® Test Automation Server.	Tests supported on Rational Test Automation Server on page 18
3	Create a project on Rational® Test Automation Server and add repositories to the project to access the test resources available in the respective repository.	Test assets and a server project on page 361
4	Configure Jira to your project on Rational® Test Automation Server where the test resources are available. Note: You must have the project Owner access to configure Jira.	Configuration of Jira as a change management system on page 304
5	Create defects for the tests available in your project.	Creating Jira defects on page 308

Generating public and consumer keys

You must first generate a public key and a consumer key for your project that is available on IBM® Rational® Test Automation Server to configure Jira.

Before you begin

You must have completed the following tasks:

- You must have installed Jira on your computer. For more information about installing Jira, refer to Installing
 Jira software.
- You must be able to access the Jira server from Rational® Test Automation Server.

About this task

After you add the URL of the Jira server to your project, you can generate both the public key and the consumer key from Rational® Test Automation Server. You can then share both the keys with the administrator of Jira server.

- 1. Log in to Rational® Test Automation Server, if you are not already logged in.
- 2. Open your project.
- 3. Expand Configure, and then click Project.
- 4. Click the Change Management System tab, and then click New System.

Result

The Configure Change Management System page is displayed.

5. Enter the URL of Jira server in the Change Management System link field, and then click Add.

Result

A public key and a consumer key are generated and displayed on the Configure Tracking System page.

Results

You have successfully generated both the public and consumer keys.

What to do next

You can then click **Copy** to copy both the keys and save the keys in your local file. You can then share both the keys with the administrator of the Jira server to setup an application link in Jira.

The administrator of the Jira server then sets up the application link in Jira by using both the keys that you shared. After the application link set up is complete, you can then configure the Jira server for your project on IBM® Rational® Test Automation Server. See Configuring the Jira server on page 306.

Configuring the Jira server

After the administrator of the Jira server sets up the application link in Jira by using both the public and consumer keys, you can configure the Jira server for your project on IBM® Rational® Test Automation Server where the tests are available.

Before you begin

You must have completed the following tasks:

- Generated a public key and a consumer key on Rational® Test Automation Server. See Generating public and consumer keys on page 305.
- Shared both the keys with the administrator of the Jira server to set up an application link in Jira.

About this task

When you share both the keys with the administrator of the Jira server, the administrator of the Jira server sets up the application link in Jira.

After the completion of setting up of the application link by the administrator of the Jira server, you can then open the **Change Management System** tab of your project and complete the authorization process to configure the Jira server for your project on Rational® Test Automation Server.

Tasks performed by the administrator of the Jira server

As an administrator of the Jira server, you must perform the following actions to set up an application link on the Jira server:

- 1. Log in to the Jira server and open the **Configure Application Links** page.
- 2. Enter the URL of the application, and then click Create new link.
- Verify the URL on the Configure Application URL page, and then click Continue to open the Link applications page.
- 4. Enter the information for the fields specified as follows on the **Link applications** page, and then click **Continue**:
 - · Application Name: Enter an application name. The application name must be unique. For example, IBM.
 - **Application Type**: Select the type of application from the **Application Type** drop-down list. The default selection is **General Application**.
 - Select the Create incoming link check box.

Note: You need not set other fields when you set up an application link to establish a connection between the Jira server and Rational® Test Automation Server.

- 5. Enter the information on the **Link applications** page for the fields specified as follows, and then click **Continue** to set up the application link:
 - **Consumer Key**: Enter the consumer key shared by the administrator of Rational® Test Automation Server
 - Consumer Name: Enter an application name. For example, IBM_1.
 - Public Key: Enter the public key shared by the administrator of Rational® Test Automation Server.

You have successfully set up the application link on the Jira server to establish a connection between the Jira server and Rational® Test Automation Server.

To know more about the application link, refer to the Configuring the client application as a consumer in Jira section.

- 1. Open your project.
- 2. Expand Configure, and then click Project.
- 3. Open the Change Management System tab.
- Click the Open action menu button from Jira Integration Details, and then click Configure.
 Result

The Authorize User page is displayed.

- 5. Complete the authorization process on the Authorize User page by performing the following actions:
 - a. Click the authorization URL of the Jira server to open the Jira authorization page.
 - b. Log in to your Jira server account with your valid credentials.
 - c. Click **Allow** to authorize the Jira server account to generate an access token.

Result

The authorization is successful.

The **Access Approved** page is displayed with a verification code.

- d. Copy the verification code, and then paste the verification code in the **Enter Verification Code** field on the **Authorize User** page.
- e. Click Save.

Result

The Configure Change Management System page is displayed.

6. Select a Jira server project that is available from the **Project** drop-down list, and then click **Update**.

Note: The change management system name and the change management system link are already displayed on the **Configure Change Management System** page.

Results

You have successfully configured the Jira server for your project on Rational® Test Automation Server.

You can see a tick icon next to the URL of the Jira server on the successful configuration. You can also expand the **Jira Integration Details** section to see the project name of the Jira that you selected.

Note: You can delete the URL of the Jira server that you no longer require in your test environment.

What to do next

You can create defects for the tests available in your project and track the defects from the **Results** page on Rational® Test Automation Server after the test run is complete. See Creating Jira defects on page 308.

Creating Jira defects

You can create a Jira defect for a test available in your project and track the defect from IBM® Rational® Test Automation Server after the test run is complete.

Before you begin

You must have completed the following tasks:

- Been a member of the project with the Owner or Tester role to create a defect for a test.
- Configured Jira in Rational® Test Automation Server for your project. See Configuration of Jira as a change management system on page 304.

Note: You must have the project Owner access to configure Jira.

• Initiated a test run of a test available in your branch from the **Execution** page.

About this task

After you configure Jira for your project on Rational® Test Automation Server, you can create a Jira defect for a test available in your project and track the defect from the **Results** page after the test run is complete.

Note: You can create a Jira defect for a test result from the **Results** page only if you have executed the test on Rational® Test Automation Server.

- 1. Open your project on Rational® Test Automation Server.
- 2. Run a test from the Execution page.
- 3. Click Results from the left pane to open the Results page.
- 4. Select the test result from the Results page.
- 5. Click the **Jira: Raise Defect** icon from **Actions**.

Important: You can create a Jira defect for a test result only if Jira is configured to your server project. If Jira is not configured with your server project and you click the **Open action menu** button from **Actions** on the **Results** page for a test result, you can see a message is displayed on the **Results** page that states that there is no change management system configured for the project. You must then contact your project *Owner* to configure Jira for the project. You project *Owner* can then click the link provided in the message to open the project to configure Jira for your project.

Result

The Raise defect in Jira page is displayed with the fields available for your project.

6. Enter the information required for all the fields, and then click Create.

Important: You can create a story, defect, or task. Creating other issue types are not supported.

Result

A Jira defect is created.

7. Expand the test result to see the Jira tracking ID details from the **Results** page.

Note: You can raise multiple defects for a test, if required.

Results

You have created a defect for a test result from the Results page on Rational® Test Automation Server.

What to do next

You can now click the Jira tracking ID from the **Results** page to open the defect and view the details. The **Reporter** field on the Jira server page displays the name of the person who has created the defect. To know more about Jira server defects and how it works, refer to the documentation.

Integrating with other applications

You can integrate certain applications with IBM® Rational® Test Automation Server to run tests, view the test results, and create defects.

Integration plugin compatibility matrix

You can find information about the versions of the integration plugin that are compatible with IBM® Rational® Test Automation Server.

The following table lists the versions of the integration plugin that are required to integrate IBM® Engineering Test Management, Jenkins, and UrbanCode™ Deploy with Rational® Test Automation Server.

Note: You must download the required version of the integration plugin from the IBM WebSphere, Liberty & DevOps Community portal based on the existing version of Rational® Test Automation Server. You can then integrate Engineering Test Management, Jenkins, and UrbanCode™ Deploy with Rational® Test Automation Server.

Rational® Test Automation Server	10.1.0	10.1.1	10.1.2	10.1.3
Jenkins plugin	RTAS-Jenkins-2.0	RTAS-Jenkins-3.0	RTAS-Jenkins-4.0	RTAS-Jenkins-4.0
UrbanCode™ Deploy plugin	RTAS-UCD-1.0	RTAS-UCD-1.0	RTAS-UCD-2.0	RTAS-UCD-2.0

Integration with Azure DevOps

When you use Azure DevOps for continuous integration and continuous development of your application, you can run tests created for your application and available in a project on IBM® Rational® Test Automation Server, in Azure DevOps pipelines by using the *IBM Rational Test Workbench* extension.

Overview

You can use the *IBM Rational Test Workbench* extension to integrate Rational® Test Automation Server with Azure DevOps.

The *IBM Rational Test Workbench* extension enables you to select any type of test available for your project in Rational® Test Automation Server that you can add to your task for the job in the Azure DevOps pipelines.

You must have created the tests in the desktop clients and committed the test assets and test resources to a remote repository. The remote repository must be added to the project.

Depending on the type of tests you want to perform on your application, you must have created any or all of the following types of tests in the desktop clients for the application you are testing:

Type of test	Desktop client
Accelerated Functional Testing suites Compound tests	IBM® Rational® Functional Tester
• Test Suite	IBM® Rational® Integration Tester
Compound tests VU Schedule Rate Schedule	IBM® Rational® Performance Tester

You can now follow the tasks listed in the task flow table to integrate Rational® Test Automation Server with Azure DevOps. See Task flow for integrating Azure DevOps on page 311.

Task flow for integrating IBM® Rational® Test Automation Server with Azure DevOps

The table shows the task flow for integrating Rational® Test Automation Server with Azure DevOps by using the *IBM Rational Test Workbench* extension. You must perform these tasks in sequence as listed in the following table. The table also provides you the links to the information about the tasks.

	Tasks	More information
1	Install Rational® Test Automation Server.	Installation of the server software on
		page 25

	Tasks	More information
2	Create tests in the desktop clients for the application you are testing.	Rational® Performance Tester documentation Rational® Functional Tester documentation Rational® Integration Tester documentation
3	Create a project on Rational® Test Automation Server and add the test assets that are created in the desktop clients to your project.	Test assets and a server project on page 361
4	Create an organization and a project in Azure DevOps for running jobs in Azure DevOps pipelines.	Creating an organization
5	Access the Visual Studio Marketplace portal and search for the latest version of the <i>IBM Rational Test Workbench</i> extension.	Visual Studio Marketplace
6	Install the latest version of the IBM Rational Test Workbench extension.	Installing the IBM Rational Test Work- bench extension on page 312

Integration with Azure DevOps on page 310

Installing the IBM Rational Test Workbench extension

You must install the latest version of the *IBM Rational Test Workbench* extension in your Azure DevOps organization before you can use the extension for running your application tests in an Azure DevOps pipeline.

Before you begin

You must have access to the **Visual Studio Marketplace** portal to install the latest version of the *IBM Rational Test Workbench* extension.

About this task

After you install the latest version of the *IBM Rational Test Workbench* extension from the **Visual Studio Marketplace** portal in your Azure DevOps organization, you can select the tests that you want to run for your application in an Azure DevOps pipeline by using the *IBM Rational Test Workbench* extension.

- 1. Log in to the Visual Studio Marketplace portal, if you are not already logged in.
- 2. Click the Azure DevOps tab.
- 3. Search for the IBM Rational Test Workbench extension.
- 4. Click the IBM Rational Test Workbench extension.
- 5. Click Get it free.

Result

The Visual Studio Marketplace portal for the IBM Rational Test Workbench extension is displayed.

- Select the organization where you want to run your test from the Select an Azure DevOps Organization list.
- 7. Click Install.

Result

The installation is completed.

8. Click Proceed to organization.

Result

The Organization page in Azure DevOps is displayed.

9. Click Organization settings > Extensions.

Result

The IBM Rational Test Workbench extension is displayed as an installed extension.

Results

You have installed the IBM Rational Test Workbench extension in your Azure DevOps organization.

What to do next

You can run tests that are available in Rational® Test Automation Server as a job in an Azure DevOps pipeline. See Running tests in an Azure DevOps Pipeline on page 313.

Running IBM® Rational® Test Automation Server tests in an Azure DevOps Pipeline

After you install the *IBM Rational Test Workbench* extension in your organization, you can run tests that are available in IBM® Rational® Test Automation Server as a job in Azure DevOps pipelines.

Before you begin

You must have completed the following tasks:

- Added the tests that you created in the desktop clients for your application to the project on Rational® Test Automation Server.
- Installed the latest version of the *IBM Rational Test Workbench* extension in your organization. See Installing the *IBM Rational Test Workbench* extension on page 312.

- Installed an agent in your pipeline. See Azure Pipelines agents.
- Generated an offline user token from Rational® Test Automation Server. See Generating an offline token on page 347.

About this task

After you add the *IBM Rational Test Workbench* extension in your Azure DevOps organization, you can use an existing pipeline or create a new one to add Rational® Test Automation Server test tasks. You can install an agent or use the one that you installed in your default agent pool. You can add Rational® Test Automation Server tests as tasks to your agent job, configure the task, and then run the task in the Azure DevOps pipeline.

- 1. Open your **Organization** page in Azure DevOps and perform the following steps:
 - a. Click the project you want to use.
 - b. Initialize the repository by performing the following steps:
 - i. Click Repos from the left pane.
 - ii. Click Initialize from the Initialize with a README or gitignore section.

Note: Select the Add a README checkbox if it is not selected.

- c. Click Pipelines from the left pane.
- d. Click Create Pipeline.
- e. Click Use the classic editor to create a pipeline without YAML.
- f. Verify the project, repository, and branch for manual and scheduled builds, and then click Continue.
- g. Click Empty job.
- 2. Select **Pipeline** and complete the following steps:
 - a. Change the name for the build pipeline if required.
 - b. Select the **Agent pool** for your build pipeline.

You can use the agent from the default agent pool or use the one you have installed.

- c. Select the **Agent Specification** for the agent if required.
- 3. Add a task to the agent job by completing the following steps:
 - a. Click the **Add Task** icon + for the agent job. **Result**

The **Add tasks** pane is displayed.

b. Search for the IBM tasks defined in the IBM Rational Test Workbench extension.

Result

The tasks that you can select are displayed.

c. Select the IBM® Rational® Test Automation Server Task, and then click Add to add the task to the agent job.

Result

The selected task is added to the agent job and it is displayed with a warning that some settings require attention. You must configure the settings mentioned in step 4 on page 315.

You can also remove the tasks that are not required in your job. Select the tasks in the list that you want to remove. You can then right-click the tasks, and click **Remove selected task(s)** to remove them.

- 4. Configure the settings by performing the following steps:
 - a. Select the task version from the list if required.
 - b. Follow the action for the task by referring to the following table:

Note: All mandatory fields are marked with an asterisk (*) in the UI.

Field	Action
Display	Enter a name of the task.
name	
IBM®	
Ratio-	Select the service connection from the drop-down list.
nal®	If you are selecting the IBM® Rational® Test Automation Server service connection for the
Test Au-	first time, you must click New to add the following details to add an IBM® Rational® Test
toma-	Automation Server service connection, and then save the connection details:
tion	
Server	

Field	Action

connec-	URL is as follows: https://hostname.
tion	Offline Token - Enter the offline token that you generated from Rational® Test Automation Server.
	tomation Server.
	Service connection name - Enter a service connection name. Description (artises). Enter the details of the convice connection if required.
	Description (optional) - Enter the details of the service connection if required. Optionally, colors the Creat access permission to all singlines should be a compared to the control of the contro
	 Optionally, select the Grant access permission to all pipelines checkbox if required.
	You can save the service connection details. The service connection is available for selec-
	tion from the IBM® Rational® Test Automation Server service connection drop-down list.
	Note:
	You can edit or delete the service connection that you added if required. Click
	Manage, and then select the service connection from the Service connections list
	to open the service connection. You can click Edit to edit the service connection
	details. If you want to delete an existing service connection details, click the Verti-
	cal ellipsis icon, and then click Delete to delete the service connection details.
	Optionally, you can also create, edit, and delete a service connection from your Azure De-
	vOps project dashboard. Open your project, click Project settings > Service connections ,
	and then perform any of the following tasks:
	Create a new service connection.
	Edit or delete an existing service connection that you already added.
Project	Enter the name of the project containing the test.
Branch	Enter the branch where the test assets are stored.
Reposi- tory Link	Enter the repository path that is configured for the project that contains the test to run.
File Path	Enter the path of the test in Rational® Test Automation Server that you want to run.
API Test Environ-	Enter the name of the environment that is configured in the test asset for the test created in Rational® Integration Tester.
ment	Note: This setting is applicable only if you are running an API suite test.

- c. Expand **Control Options** and configure the settings for your task if required.
- d. Expand **Output Variables** and configure the settings for your task if required.

- 5. Select from the following options:
 - a. Click Save to save the configured settings for the task.

Note: The task is not queued for a run.

You can save the task to a build pipeline and opt to run the build at a later time.

b. Click Save & queue to save the configurations and queue the run in the pipeline.

Result

The Run pipeline dialog box is displayed.

- 6. Complete the following steps:
 - a. Enter a comment for the test in the Save comment field.
 - b. Select the agent that you configured for the test from the **Agent pool** list.
 - c. Select the agent specification from the Agent Specification list if required.
 - d. Select the branch from the Branch/tag list.
 - e. Add the variables and demands for the task run from the Advanced Options pane if required.
 - f. Select the **Enable system diagnostics** checkbox for a detailed log view.
 - g. Click Save and run.

Result

The pipeline summary page displays the progress of the job run.

Results

You have run the tests for the application you are testing, in the Azure DevOps pipeline.

What to do next

You can open the job to view the task logs from the pipeline summary page.

You must click the task to open the **Task** page to view the test results. The **Reports information** section on the **Task** page displays the names of the report along with its corresponding URLs. The report URLs are the Rational® Test Automation Server URLs where the reports are stored. You can access the report URLs to view the test execution information at any point of time.

You can also view the test reports and logs of the test that was run on the Azure DevOps from the **Results** page on Rational® Test Automation Server. See Test results and reports overview on page 268.

Integration with Jenkins

When you integrate IBM® Rational® Test Automation Server with Jenkins, you can run tests created for your application and available in a project on Rational® Test Automation Server from a Jenkins server by using the Rational® Test Automation Server Jenkins plugin.

Prerequisites

You must have installed Jenkins on your computer. For more information about installing Jenkins, refer to Installing Jenkins.

You can then run the following command to start the Jenkins server to support UTF-8 character sets:

java -Dfile.encoding=UTF8 -jar jenkins.war

Overview

You can use the Rational® Test Automation Server Jenkins plugin to integrate Rational® Test Automation Server with Jenkins.

You must have created the tests in the desktop clients and committed the test assets and test resources to a remote repository. The remote repository must be added to the project.

Depending on the type of tests you want to perform on your application, you must have created any or all of the following types of tests in the desktop clients for the application you are testing:

Type of test	Desktop client
Accelerated Functional Testing suites Compound tests	IBM® Rational® Functional Tester
• Test Suite	IBM® Rational® In- tegration Tester
Compound tests VU Schedule Rate Schedule	IBM® Rational® Performance Tester

You can now follow the tasks listed in the task flow table to integrate Rational® Test Automation Server with Jenkins. See Task flow for integrating Jenkins.

Task flows for running test assets from Jenkins

You can perform certain tasks to run test assets from the Jenkins Freestyle project.

The following table lists the task flows for running test assets from the Jenkins Freestyle project:

Tasks	More information
Install the Rational® Test Automation Server Jenkins plugin.	Installing the Rational Test Automation Server Jenkins Plugin on page 319
Import the CA certificate to your custom trust store.	Using a custom trust store on page 319
Configure the Freestyle project.	Configuring the Freestyle project on page 321
Run Rational® Test Automation Server test assets on Jenkins.	Running IBM Rational Test Automation Server tests on the Jenkins server on page 324

Installing the Rational® Test Automation Server Jenkins Plugin

You must install the latest version of the Rational® Test Automation Server plugin on the Jenkins server before you can use the plugin for running tests that are available in your IBM® Rational® Test Automation Server project on the Jenkins server.

Before you begin

You must have downloaded the Rational® Test Automation Server Jenkins plugin RTAS-Jenkins-4.0 from the IBM WebSphere, Liberty & DevOps Community portal.

- 1. Open the Jenkins dashboard.
- 2. Click Manage Jenkins > Manage Plugins.
- 3. Click Advanced.
- 4. Click **Choose File** to locate and **Open** the Rational® Test Automation Server Jenkins plugin file from the **Upload Plugin** section.
- 5. Click Upload.

Result

The Rational® Test Automation Server Jenkins plugin is displayed in the Installed tab.

What to do next

You can run the tests that are available in Rational® Test Automation Server on the Jenkins server. See Running Rational® Test Automation Server tests on the Jenkins server on page 324.

Using a custom trust store

You can use a custom trust store in the Jenkins build step of a Rational® Test Automation Server Jenkins plugin to establish a trusted and secure connection between the Jenkins server and Rational® Test Automation Server.

Before you begin

You must have configured the certificate that is used by Rational® Test Automation Server as a trusted CA, and then install Rational® Test Automation Server. See Installation of the server software on page 25.

About this task

If the SSL certificate assigned to Rational® Test Automation Server is signed by an internal Certified Authority (CA), then you must download and import the CA certificate to a custom trust store. You can then use the custom trust store in the Jenkins plugin build step to establish a trusted and secure connection between the Jenkins server and Rational® Test Automation Server.

Note: If the internal CA certificate is already imported to the default trust store that is used by the Jenkins server, you need not use a custom trust store.

Restriction:

When you use Red Hat Enterprise Linux (RHEL) operating systems for Jenkins, you must run the Jenkins service with a user who has access to the custom trust store path to utilize the custom trust store feature. To change the Jenkins user, you must open the /etc/sysconfig/jenkins file and set the JENKINS_USER to the user who has access to the custom trust store path.

You can then run the following commands to set JENKINS_USER to another user who has access to the path of the custom trust store:

\$JENKINS_USER= <username>

For example, \$JENKINS_USER= <user1>

Note: You must ensure that the user account is available in the /etc/passwd file.

You can then run the following commands to change the ownership of the Jenkins folder:

chown -R username:username /var/lib/jenkins
chown -R username:username /var/cache/jenkins
chown -R username:username /var/log/jenkins

For example,

chown -R user1:user1 /var/lib/jenkins
chown -R user1:user1 /var/cache/jenkins
chown -R user1:user1 /var/log/jenkins

After the change of ownership is complete, run the following command to restart the Jenkins server:

/etc/init.d/jenkins restart

- 1. Locate the default trust store file (cacerts file) in your JRE directory from your computer, and then copy the file to a location of your choice on your computer.
- 2. Run the following command from the command prompt or terminal to import the CA certificate to your custom trust store:

keytool -import -trustcacerts -file <path to the downloaded CA certificate with the file
extension> -alias <custom label for the certificate> -keystore <path to the trust store>

For example,

keytool -import -trustcacerts -file C:\Users\ca file.crt -alias alias1 -keystore D:\cert\cacerts

Note: The default password of the trust store is *changeit*. It remains the same for the custom trust store. If you want to change the password, you can run the following command, and then enter the new password:

keytool -storepasswd -keystore <path to the trust store>

For example, keytool -storepasswd -keystore D:\cert\cacerts

Results

You have successfully imported the downloaded CA certificate to the custom trust store.

What to do next

You can add the Rational® Test Automation Server tests to the Jenkins build step, and then run the tests from the Jenkins server.

Configuring the Freestyle project

You must configure a **Freestyle** project to add a build step, and then run tests that are available in your Rational® Test Automation Server project from Jenkins.

Before you begin

You must have completed the following tasks:

- Installed the Rational® Test Automation Server Jenkins plugin on the Jenkins server. See Installing the Rational Test Automation Server Jenkins Plugin on page 319.
- Created a Jenkins Freestyle project.
- Generated an offline user token from Rational® Test Automation Server. See Managing access to IBM Rational Test Automation Server on page 347.

- 1. Click the **Build** tab, and then click **Add build step**.
- 2. Select the Run IBM Rational Test Automation Server test option from the drop-down list.
- 3. Provide the details about the test run for the fields in the following table:

Field	Description	
Name	Enter a name for the Jenkins build step.	
Use Custom Trust Store	Select the Use Custom Trust Store checkbox if you have used an internal CA certificate and have imported the certificate to the custom trust store. You can then enter the file path of your trust store followed by the file name in the Custom Trust Store Path field.	
	Select the Use Custom Password for the Trust Store checkbox if you have modified the trust store password, and then enter the new password in the Custom Trust Store Password field.	
	Note: If you have not modified the trust store password, you must clear the Use Custom Password for the Trust Store checkbox.	
Server URL	Enter the URL of Rational® Test Automation Server.	
	The format of the URL is as follows: https://hostname.	
Offline To- ken	Enter the offline user token that you generated from Rational® Test Automation Server.	
Team Space	Select the name of the team space from the drop-down list.	
	The Team Space drop-down list displays the names of the team spaces if you are an <i>Owner</i> or a <i>member</i> of the team space.	
Project	Select a project from the drop-down list.	
	The Project drop-down list displays the projects that are available in the corresponding team space of Rational® Test Automation Server.	
	Note: The Project drop-down list displays the projects where you are an Owner or a member of Rational® Test Automation Server. You must be an Owner or a Tester of the project that is available in the team spaces to run the tests from the Jenkins server.	
Branch	Select the branch from the drop-down list.	
	The Branch drop-down list displays the branches available in the corresponding project of Rational® Test Automation Server.	

Field	Description
	Note: After you select the branch from the Branch drop-down list, if you want to change the URL, offline user token, or the project in the Build, then you must close the build step. Then you must click Add build step, select Run IBM® Rational® Test Automation Server test, and then enter the details.
Asset Type	Select the test asset type that you want to run from the Asset Type drop-down list.
	The available options for the Asset Type field are as follows:
	∘ AFT Suite
	∘ API Suite
	∘ Compound Test
	∘ Rate Schedule
	∘ VU Schedule
	Notes:
	 You cannot run the following test assets from the Jenkins server:
	• API test
	Functional test
	Performance test
	 The Test Environment field is mandatory if you select APISUITE as an asset type to run an API suite.
Test	Select the required test from the drop-down list.
	The Tests drop-down list displays the available test assets from the corresponding branch in the following format:
	Project_name [Path: the path of the test assets] [Repo: URL of the Git repository that the test belongs to]
	Note: After you select the test details from the Tests drop-down list if you want to change the URL, offline user token, or the project in the Build step, then you must close the build step. You must then click Add build step, select Run IBM® Rational® Test Automation Server test, and then enter the details.
Test Envi- ronment	This field is mandatory only if you select Asset Type as APISUITE .

Field	Description
	The Test Environment list displays the available test environments from Rational® Test Automation Server.
	Note: The following message is displayed when you select any other asset type apart from APISUITE in the Asset Type field:
	You can select Test Environment only if you are running tests of type APISUITE.

Note: You can run multiple tests sequentially in the same job by adding multiple build steps and providing details for the tests that you want to run.

4. Click Save to save the build step.

Results

You have configured the Freestyle project by adding the build step.

What to do next

You can run test assets from the Jenkins server. See Running IBM Rational Test Automation Server tests on the Jenkins server on page 324.

Running IBM® Rational® Test Automation Server tests on the Jenkins server

After you install the Rational® Test Automation Server Jenkins plugin on the Jenkins server, you can run tests that are available in your IBM® Rational® Test Automation Server project on the Jenkins server.

Before you begin

You must have completed the following tasks:

- · Added the tests that you created in the desktop clients for your application to the project on Rational® Test Automation Server.
- Install the latest version of the Rational® Test Automation Server Jenkins plugin on the Jenkins server. See Installing the IBM® Rational® Test Automation Server Jenkins Plugin on page 319.
- · Generated an offline user token from Rational® Test Automation Server. See Generating an offline token on page 347.
- Created a Jenkins free-style software project. See Building a software project in Jenkins.
- 1. Login to the Jenkins server, if you are not already logged in.
- 2. Open your Jenkins free-style software project.
- 3. Click Configure.
- 4. Click the Build tab.

5. Click Add build step, and then click Run IBM® Rational® Test Automation Server test. Result

The Run IBM® Rational® Test Automation Server test pane is displayed.

a. Provide details about the test run by referring to the following table.

Description	
Enter a name for the Jenkins build step.	
Select the Use Custom Trust Store checkbox if you have used an internal CA certificate and have imported the certificate to the custom trust store.	
You can then enter the file path of your trust store followed by the file name in the Custom Trust Store Path field.	
You can select the Use Custom Password for the Trust Store checkbox if you have modified the trust store password. Enter the new password.	
Note: If you have not modified the trust store password, you can keep the Use Custom Password for the Trust Store checkbox unselected.	
Enter the URL of Rational® Test Automation Server. The format of the URL is as follows: https://hostname.	
Enter the offline user token that you generated from Rational® Test Automation Server.	
Select a project from the Project list. The Project list displays the projects where you are the owner or member of Rational® Test Automation Server.	
Select the branch from the Branch list. The Branch list displays the branches available in the corresponding project of Rational® Test Automation Server.	
Note: After you select the branch from the Branch list, if you want to change the URL, offline user token, or the project in the Build, then you must close the build step. Then you must click Add build step, select Run IBM® Rational® Test Automation Server test, and then enter the details.	
Select the test asset type of the test that you want to run from the Asset Type list. The	
available asset types are as follows: • AFTSUITE • COMPOUND • VUSCHEDULE	

Field	Description
	 RATESCHEDULE APISUITE Note: The test environment is mandatory if you select APISUITE as an asset type to run an API suite.
Test	Select the required test from the Tests list. The Tests list displays the available test assets from the corresponding branch in the selected project, test asset path, and the repository (that the test belongs to) from Rational® Test Automation Server based on the type of the test asset you selected from the Asset Type list. Note: After you select the test details from the Tests list, if you want to change the URL, offline user token, or the project in the Build , then you must close the build step. You must then click Add build step , select Run IBM® Rational® Test Automation Server test , and then enter the details.
Test Envi- ronment	This field is mandatory only if you are running an API suite test. Based on the asset type as APISUITE and test from the Tests list that you select, the Test Environment list displays the available test environments from Rational® Test Automation Server. Note: The following message is displayed when you select any other asset type apart from APISUITE in the Asset Type field: You can select Test Environment only if you are running tests of type APISUITE.

- b. Click **Save** to save the build step.
- c. Optionally, you can run multiple tests sequentially in the same job by adding multiple build steps and provide details for the tests that you want to run.
- 6. Click **Build Now** from the left pane to run the test on the Jenkins server.

Results

The Jenkins dashboard shows the progress of the test run.

What to do next

After the Jenkins build completes, you can view the test results. You can click the build number from the **Build History** pane on the Jenkins dashboard. You can then click **Console Output** to view a detailed log of the build from the console output.

The \mathtt{Test} Result displays the status of the completed test that you ran.

Note: If you add multiple build steps to run multiple tests, multiple Test Result instances are displayed.

The **Reports information** section displays the names of the report along with its corresponding URLs. The report URLs are the Rational® Test Automation Server URLs where the reports are stored. You can access the report URLs to view the test execution information at any point of time.

You can also view the test reports and logs of the test that was run on the Jenkins server from the **Results** page on IBM® Rational® Test Automation Server. See Test results and reports overview on page 268.

Integration with UrbanCode Deploy

When you use UrbanCode™ Deploy (UCD) for automating application deployments of your application, you can run tests created for your application and available in a project on IBM® Rational® Test Automation Server from UCD by using the IBM® Rational® Test Automation Server UCD plugin.

Overview

You can use the IBM® Rational® Test Automation Server UCD plugin to integrate Rational® Test Automation Server with UCD.

You must have created the tests in the desktop clients and committed the test assets and test resources to a remote repository. The remote repository must be added to the project.

Depending on the type of tests you want to perform on your application, you must have created any or all of the following types of tests in the desktop clients for the application you are testing:

Type of test	Desktop client
Accelerated Functional Testing suites Compound tests	IBM® Rational® Functional Tester
• Test Suite	IBM® Rational® Integration Tester
Compound tests VU Schedule Rate Schedule	IBM® Rational® Performance Tester

You can now follow the tasks listed in the task flow table to integrate Rational® Test Automation Server with UCD. See Task flow for integrating UrbanCode Deploy.

Installing the IBM® Rational® Test Automation Server UCD plugin

You must install the latest version of the IBM® Rational® Test Automation Server UCD plugin to integrate IBM® Rational® Test Automation Server with UCD and run tests on the UCD server.

Before you begin

You must have downloaded the IBM® Rational® Test Automation Server UCD plugin RTAS-UCD-2.0 from the IBM WebSphere, Liberty & DevOps Community portal.

- 1. Open the UCD dashboard.
- 2. Click Settings.
- 3. Click Automation Plugins from the Automation pane.
- 4. Click Load Plugin.
- 5. Click **Choose File** to locate and **Open** the compressed IBM® Rational® Test Automation Server UCD plugin file.

Note: Do not extract the IBM® Rational® Test Automation Server UCD plugin compressed file contents.

6. Click Submit.

Result

The IBM® Rational® Test Automation Server UCD plugin is displayed in the Automation Plugins tab.

What to do next

You can run the tests for the application that are available in your Rational® Test Automation Server project on the UCD server. See Running tests on the UCD server on page 341.

Using a custom trust store for UCD integration

You can use a custom trust store in the IBM® Rational® Test Automation Server UCD plugin file to establish a trusted and secure connection between the UCD server and Rational® Test Automation Server.

Before you begin

You must have configured the certificate that is used by Rational® Test Automation Server as a trusted CA, and then install Rational® Test Automation Server. See Installation of the server software on page 25.

About this task

If the SSL certificate assigned to Rational® Test Automation Server is signed by an internal Certified Authority (CA), then you must download and import the CA certificate to a custom trust store. You can then use the custom trust store in the IBM® Rational® Test Automation Server test process step to establish a trusted and secure connection between the UCD server and Rational® Test Automation Server.

Note: If the internal CA certificate is already imported to the default trust store that is used by the UCD server, you need not use a custom trust store.

- 1. Locate the default trust store file (cacerts file) in your JRE directory from your computer, and then copy the file to a location of your choice on your computer.
- 2. Run the following command from the command prompt or terminal to import the CA certificate to your custom trust store:

keytool -import -trustcacerts -file <path to the downloaded CA certificate with the file
extension> -alias <custom label for the certificate> -keystore <path to the trust store>

For example,

keytool -import -trustcacerts -file C:\Users\ca file.crt -alias alias1 -keystore D:\cert\cacerts

Note: The default password of the trust store is *changeit*. It remains the same for the custom trust store. If you want to change the password, you can run the following command, and then enter the new password:

keytool -storepasswd -keystore <path to the trust store>

For example, keytool -storepasswd -keystore D:\cert\cacerts

Results

You have successfully imported the downloaded CA certificate to the custom trust store.

What to do next

You can then run the tests that are available in your Rational® Test Automation Server project from the UCD server.

Creating a component in UrbanCode™ Deploy

You must create a component to include artifacts and processes. The artifacts include runnable files, images, databases, configuration instructions. Whereas the processes define the activities that components can perform.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have been granted access to UrbanCode™ Deploy.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

- 2. Click Components, and then click Create Component.
- 3. Enter a name for the component in the **Name** field.
- 4. Enter the details in the other optional fields based on your requirement, and then click Save.

Result

The component that you created is displayed.

Results

You have created the component in UrbanCode™ Deploy.

What to do next

You must create a process for the component in UrbanCode™ Deploy. See Creating a process in UrbanCode Deploy on page 330.

Related information

IBM UrbanCode Deploy Documentation

Creating a process in UrbanCode™ Deploy

You must create a process for the component to include step properties for the test that you want to run from UrbanCode™ Deploy.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- · You must have performed the following tasks:
 - Been granted access to UrbanCode™ Deploy.
 - Created a component in UrbanCode™ Deploy. See Creating a component in UrbanCode Deploy on page 329.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

2. Click Components.

Result

A list of components that are available in UrbanCode™ Deploy is displayed.

- 3. Select the component from the list for which you want to create a process.
- 4. Click the Processes tab, and then click Create Process.

Result

The Create Process dialog is displayed.

- 5. Enter a name for the process in the Name field.
- 6. Select Operational (No Version Needed) from Process Type drop-down list.
- 7. Verify the **Default Working Directory** field.

The **Default Working Directory** field defines the location that the agent uses to run the process. The default value is $fp:resource/work.dir}/$fp:component.name$.

Where $\{p:resource/work.dir\}$ is the default working directory for the agent and $\{p:component.name\}$ is the name of the component.

8. Click Save.

Result

The process that you created is listed in the Processes tab and the Design tab for the process is displayed.

Results

You have created the process for the component in UrbanCode™ Deploy.

What to do next

You must configure the process in UrbanCode™ Deploy. See Configuring the process on page 331.

Related information

IBM UrbanCode Deploy Documentation

Configuring the process

You must configure the process that you created for the component to organize the steps in the process, specify the properties of the steps, and connect them.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have performed the following tasks:
 - Been granted access to UrbanCode™ Deploy.
 - Created a component in UrbanCode™ Deploy. See Creating a component in UrbanCode Deploy on page 329.
 - Created a process for the component in UrbanCode[™] Deploy. See Creating a process in UrbanCode
 Deploy on page 330.
 - Generated an offline user token from Rational® Test Automation Server. See Generating an offline token on page 347.
 - Added the tests assets to the project on Rational® Test Automation Server.

About this task

When you open any process to configure, the process is displayed in the process editor. The process editor lists the plugins and steps. The required **Start** and **Finish** steps represent the beginning and the end of the process and steps are automatically placed on the design area.

1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

2. Click Components.

Result

A list of components that are available in UrbanCode™ Deploy is displayed.

- 3. Select the component from the list in which you created the process.
- 4. Click the Processes tab.

Result

A list of processes that are available for the component is displayed.

5. Select the process from the list that you want to configure.

Result

The **Design** tab for the process is displayed.

- 6. Click IBM Rational Test Workbench, and then IBM Rational Test Automation Server from the left menu.
- 7. Drag the Run IBM Rational Test Automation Server test step, and then drop it into the design area.

Note: The selected test must be placed between Start and Finish steps.

- 8. Specify the properties for the selected test by performing the following steps:
 - a. Click the Edit icon.

Result

The Edit Properties for Run IBM Rational Test Automation Server test dialog is displayed.

b. Specify the properties for the selected test step by referring to the following tables:

The following table lists the required fields that you must provide to run the test from UrbanCode™ Deploy:

Fields	Action	
Name	Enter the name for the test step.	
IBM Rational Test Automation Server URL	Enter the URL of Rational® Test Automation Server.	
Offline Token	Enter the offline token that you generated from Rational® Test Automation Server.	

Fields	Action
Team Space Name	Enter the name of the team space that contains the project.
	Note: The license for the team space must be configured and you must be a member of that team space.
Project Name	Enter the name of the project that are available in the team space.
Repository Link	Enter the URL of the Git repository that you added to your project in Rational® Test Automation Server.
File Path	Enter the path of the test assets that you want to run. You can find the path of the test assets from the Execution page
	in Rational® Test Automation Server

The following table lists the optional fields that you can provide to run the test from UrbanCode™ Deploy:

Fields	Description	
Branch Name	Use this field to enter the name of the branch in the Git repository where you stored test assets.	
Custom Trust Store Pass- word	Use this field to enter the trust store password if you have modified the password while creating the custom trust store. Note: If you have not modified the trust store password, you can retain the Custom Trust Store Password field blank.	
Custom Trust Store Path	Use this field to enter the file path of your trust store followed by the file name if Rational® Test Automation Server uses an internal CA certificate and you have imported the certificate to a custom trust store.	
Datasets	Use this field to enter the path to the dataset if you want to replace the values of the dataset during a test run.	

Fields	Description
	You must ensure that both original and new datasets are in the same workspace and
	have the same column names. When you enter a value for the Datasets field, you must al-
	so include the path to the dataset. The path must be in the following format:
	<pre>/project_name/ds_path/original_ds.csv:/project_name/ds_path/new ds.csv</pre>
	Note: You can override multiple datasets that are saved in a different project by adding multiple paths to the dataset separated by a semicolon.
Environ- ment	Use this field to enter the environment details for the following types of test assets: • APISUITE • APITEST • APISTUB
Labels	Use this field to add labels to test results when the test run is complete.
	You can add multiple labels to a test result separated by a comma.
	For example, label1, label2
	After the test run is complete, then the values provided in the Labels field are displayed on the Results page of Rational® Test Automation Server.
Secrets Col- lection	Use this field to enter the name of the Secret if you created secrets collections for your project and to use Secrets at test run time.
Name	This field is mandatory only if you want to run the following types of test assets:
	• APISUITE
	• APITEST • APISTUB
Show Hidden Proper-	Select this checkbox if you want to use an HTTP Proxy to connect to Rational® Test Automation Server.
ties	After you select the Show Hidden Properties checkbox, you can configure the HTTP Proxy by using the following fields:

Fields	Description
	HTTP Proxy Host: Use this field to enter the hostname of the HTTP proxy that you want to connect to Rational® Test Automation Server.
	HTTP Proxy Port: Use this field to enter the port number where the HTTP proxy is used to listen to both HTTP and HTTPS traffic.
	HTTP Proxy User name: Use this field to provide the username for the HTTP proxy.
	 HTTP Proxy Password: Use this field to enter a valid password for the user that you specified in the HTTP Proxy User name field.
	Note: You can use the Show Hidden Properties field only when you want to run the following types of test assets: APISUITE APITEST APISTUB
Start Date	Use this field to enter the date and time in the following format for running tests at the scheduled date and time:
	yyyy/MM/dd/HH:mm
	When you enter a value in the Start date field, the status of the test displays as <code>scheduled</code> on the Overview and Progress pages of Rational® Test Automation Server.
Variables	Use this field to enter the name of the variable and its value if your test requires variables during the test run time.
	You must enter the variables in the following format:
	name_of_the_variable=value_of_the_varibale
	You can add multiple variables to the test run separated by a semicolon.
	For example, varname1=value1;varname2=value2

Note: In addition to optional fields, you can also use the following fields from UrbanCode™ Deploy to configure your test run:

- Working Directory
- Precondition

- Post Processing Script
- Use Impersonation
- Auth Token Restriction

You can accept the default values or change the values based on your requirements. For more information about these fields, see the related links.

- c. Click **OK** to save the properties for the test.
- 9. Click Save in the design area.

Results

You have configured the process for the component in UrbanCode™ Deploy.

What to do next

You must create a resource in UrbanCode™ Deploy. See Creating a resource in UrbanCode Deploy on page 336.

Related information

IBM UrbanCode Deploy Documentation

Process step preconditions

Post-processing scripts

User impersonation for process steps

Restricting authentication tokens

Creating a resource in UrbanCode™ Deploy

You must create a resource to associate agents with components that you created in UrbanCode™ Deploy.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have been granted access to UrbanCode™ Deploy.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

2. Click Resources, and then click Create Top-Level Group.

Result

The Create Resource dialog is displayed.

- 3. Enter a name for the resource in the Name field.
- 4. Click Save.

Results

You have created the resource in UrbanCode™ Deploy.

What to do next

You must configure the resource. See Configuring the resource on page 337.

Related information

IBM UrbanCode Deploy Documentation

Configuring the resource

You must configure the resource to add an agent and associate the agent with the component.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have performed the following tasks:
 - Been granted access to UrbanCode™ Deploy.
 - Created a component in UrbanCode™ Deploy. See Creating a component in UrbanCode Deploy on page 329.
 - Created a resource in UrbanCode™ Deploy. See Creating a resource in UrbanCode Deploy on page 336.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

2. Click Resources.

Result

A list of resources that are available in UrbanCode™ Deploy is displayed.

- 3. Perform the following steps to add an agent to the resource:
 - a. Click the resource from the list for which you want to add an agent.
 - b. Click the Actions icon from the last column, and then click Add Agent.
 - c. Select the agent from the drop-down list.

Note: The Name field is auto populated with the name of the agent.

d. Click Save.

Result

The selected agent is added to the resource and you can view the status of the agent in the **Status** column.

- 4. Perform the following steps to add a component to the agent:
 - a. Click the agent from the list for which you want to add a component.
 - b. Click the Actions icon from the last column, and then click Add Component.
 - c. Select the component from the drop-down list.

Note: The Name field is auto populated with the name of the component.

d. Click Save.

Result

The selected component is added to the agent.

Results

You have configured the resource in UrbanCode™ Deploy.

What to do next

You must create an application. See Creating an application in UrbanCode Deploy on page 338.

Related information

IBM UrbanCode Deploy Documentation

Creating an application in UrbanCode™ Deploy

You must create an application to fetch all the components together that you want to deploy.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have been granted access to UrbanCode™ Deploy.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

- Click Applications.
- 3. Click Create Applications, and then New Applications.
- 4. Enter a name for the application in the Name field.

Result

The **Environments** page for the application that you created is displayed.

Results

You have created the application in UrbanCode™ Deploy.

What to do next

You must configure the application. See Configuring the application on page 339.

Related information

IBM UrbanCode Deploy Documentation

Configuring the application

You must configure the application to associate resources with environments and define processes to run test assets.

Before you begin

- You must be familiar with working with UrbanCode™ Deploy.
- You must have performed the following tasks:
 - Been granted access to UrbanCode™ Deploy.
 - Created a component in UrbanCode™ Deploy. See Creating a component in UrbanCode Deploy on page 329.
 - Created a process for the component in UrbanCode™ Deploy. See Creating a process in UrbanCode
 Deploy on page 330.
 - Configure the process for the component in UrbanCode™ Deploy. See Configuring the process on page 331.
 - Created a resource in UrbanCode™ Deploy. See Creating a resource in UrbanCode Deploy on page 336.
 - Configured the resource in UrbanCode™ Deploy. See Configuring the resource on page 337.
 - Created an application in UrbanCode™ Deploy. See Creating an application in UrbanCode Deploy on page 338.
- 1. Log in to UrbanCode™ Deploy, if you are not already logged in.

Result

The UrbanCode™ Deploy dashboard is displayed.

2. Click Applications.

Result

A list of applications that are available in UrbanCode™ Deploy is displayed.

3. Click the application that you want to configure from the **Name** column.

Result

The **Environments** page for the selected application is displayed.

- 4. Perform the following steps to create an environment for the application that you selected:
 - a. Click Create Environment.
 - b. Enter a name for the environment in the Name field.
 - c. Click Save.
- 5. Perform the following steps to configure resources to the environment:
 - a. Click the environment that you created.
 - b. Click Add Base Resources.

Result

A list of resources that are available in UrbanCode™ Deploy is displayed.

- c. Select the checkbox to add resources to the environment.
- d. Click Save.

Result

You can view the corresponding agent and the component that you added for the resource by using the **Expand** icon.

- 6. Perform the following steps to add the component to the application:
 - a. Click Applications, and then select your application from the list.
 - b. Click the Components tab, and then Add Components.
 - c. Select the checkbox from the drop-down list to add components to the application.
 - d. Click Save.
- 7. Perform the following steps to create a process for the application:
 - a. Click the Processes tab, and then Create Process.
 - b. Enter a name for the process in the Name field.
 - c. Click Save.

Result

The **Design** tab for the process that you created is displayed.

- 8. Drag the component process listed under the **Component Process Steps** option from the left navigation pane and drop it into the design area.
- 9. Select the component process from the drop-down list in the Operational (No Version Needed) Process field.
- 10. Click Save.
- 11. Click the **Edit** icon, and then change the name of the properties.
- 12. Click OK, and then click Save.

Results

You have configured the application to run test assets from UrbanCode™ Deploy.

What to do next

You can run test assets from UrbanCode™ Deploy. See Running IBM Rational Test Automation Server tests on the UCD server on page 341.

Related information

IBM UrbanCode Deploy Documentation

Running IBM® Rational® Test Automation Server tests on the UCD server

After you install the IBM® Rational® Test Automation Server UCD plugin on the UCD server, you can create a process request that contains the test for your application, and then run the test on the UCD server.

Before you begin

You must have completed the following tasks:

- Added the tests that you created in the desktop clients for your application to the project on IBM® Rational®
 Test Automation Server.
- Installed the latest version of the IBM® Rational® Test Automation Server UCD plugin. See Installing the plugin on page 328.
- Generated an offline user token from Rational® Test Automation Server. See Generating an offline token on page 347.

About this task

After you have installed the IBM® Rational® Test Automation Server UCD plugin on the UCD server, you can either use an existing component in your project or create a component. You can create a component process and select the IBM® Rational® Test Automation Server test step to edit the step properties for the test you want to run. After selecting the agent, you can create an application. You can then create an application process for the application, and then submit the application process for a run.

- 1. Log in to the UrbanCode Deploy (UCD) server, if you are not already logged in.
- 2. Click Components from the UCD dashboard, and then click Create Component to create a component.

Note: You can either use an existing component or create a component.

- 3. Create a component process in the component by performing the following steps:
 - a. Open the component that you created.
 - b. Click the Processes tab from the component dashboard, and then click Create Process.
 Result

The Create Process dialog box is displayed.

c. Enter the required values to create a component process and click Save.

Note: All mandatory fields are marked with an asterisk (*) in the UI.

- i. Enter the process name in the **Name** field.
- ii. Select Operational (No Version Needed) from the Process Type list.

Note: The Default Working Directory field displays the folder path where the agent can download the artifacts and create temporary files.

The process that you created is listed in the **Processes** list and the **Design** tab for the process is displayed.

Note: The process opens in the process editor. The process editor lists the plugins and steps. The required Start and Finish steps represent the beginning and the end of the process and are automatically placed on the design area.

- 4. Select the process step you want to run by completing the following steps:
 - a. Search for the IBM® Rational® Test Automation Server test process step from the left design pane.
 - b. Select the Run IBM® Rational® Test Automation Server test process step and drag the test into the design area.

Result

The selected test is placed in between the **Start** and **Finish** steps.

- 5. Specify the properties for the selected test by performing the following steps:
 - a. Click the **Edit** icon

Result

The Edit Properties for Run IBM® Rational® Test Automation Server test dialog box of the selected test is displayed.

b. Specify the properties for the selected test step by following the action in the table that follows.

Note: All mandatory fields are marked with an asterisk (*) in the UI.

Field	Action required for a IBM® Rational® Test Automation Server test
Name	Enter the name of the step.

Field	Action required for a IBM® Rational® Test Automation Server test
IBM® Rational® Test Automation Server URL	Enter the URL for Rational® Test Automation Server.
Offline Token	Enter the offline token that you generated from Rational® Test Automation Server.
File Path	Enter the file path of the Rational® Test Automation Server test that you want to run.
Branch Name	Select the branch where the test assets are stored.
Repository Link	Enter the repository path for the test to run.
Project Name	Enter the name of the project that contains the test to run.
RIT Environment	Enter the IBM® Rational® Integration Tester environment details for the test. Note: This field is applicable only for an API test.
Field	Optional action for a IBM® Rational® Test Automation Server test
Working Directory	Specify an alternative path to the working directory for this step. 1
Post Processing Script	Specify if you want to run any scripts after the completion of the test run. You can click New to add new scripts. 1
Precondition	Specify any conditions that are to be completed before the test runs. You can edit the script by clicking the script displayed. 1
Use Impersonation checkbox	Select this checkbox to run the test as a different user. 1
Auth Token Restriction	Set the authentication token actions by applying token restrictions.
	The System Default is selected by default. You can add a new to- ken restriction or edit the one already added. ¹
Custom Trust Store Path	Enter the file path of your trust store followed by the file name in the Custom Trust Store Path field if the IBM® Rational® Test Automation Server uses an internal CA certificate and you have imported the certificate to a custom trust store.
Custom Trust Store Password	Enter the trust store password if you have modified the password while creating the custom trust store.

1. You need not set this property for a step when you are running an Rational® Test Automation Server test.

Field	Action required for a IBM® Rational® Test Automation Server test
	Note: If you have not modified the trust store password, you can keep the Custom Trust Store Password field blank.

- c. Click **OK** to save the properties for the test.
- 6. Click Save in the design area.
- 7. Click the **Resources** tab from the UCD dashboard and create a resource by clicking **Create Top-Level Group**. **Result**

The created resource is displayed on the **Resource Tree** tab page.

8. Select the agent that runs the test by completing the following steps:

Important: You must have already installed the agent on the UCD server that you want to use.

- a. Select the resource displayed on the Resource Tree tab page.
- b. Click the **Horizontal ellipsis** icon for the selected resource.
- c. Click Add Agent.
- d. Select the agent to add to the resource, and then click Save.

Result

The selected agent is added to the resource in the **Resource Tree** pane and the status of the agent can also be viewed.

Important: The agent must be **Online** for the test to run.

- 9. Add the component to the agent by performing the following steps:
 - a. Click the **Horizontal ellipsis** icon for the agent.
 - b. Click Add Component on the list.
 - c. Select the component to add to the resource, and then click Save.

Result

The selected component is added to the agent for the resource in the **Resource Tree** pane.

10. Create an application by completing the following steps:

- a. Click the Applications tab from the UCD dashboard.
- b. Click Create Application.
- c. Complete the details in the Create Application dialog box, and then click Save.

Result

The **Environments** tab page is displayed for the created application.

- d. Click Create Environment to create an environment for the application that you created.
- e. Complete the details in the Create Environment dialog box, and then click Save.

Result

The environment that you created is displayed.

- f. Click the environment to open, and then click Add Base Resources.
- g. Select the resource from the list in the Add Resource to Environment dialog box, and then click Save to add the resource to the environment.

Result

The resource added to the environment is displayed.

Note: When you add a resource to an environment, the corresponding agent and the component are displayed for the resource.

h. Click the application from the breadcrumbs.

Result

The **Environments** tab page is displayed for your application.

- i. Add the component to the application by performing the following steps:
 - i. Click the Components tab.
 - ii. Click Add Component.
 - iii. Select the component from the list in the Add a Component dialog box, and then click Save.

Result

The selected component is displayed on the **Components** tab page.

- j. Create a process for the application by performing the following steps:
 - i. Click the Processes tab.
 - ii. Click Create Process.
 - iii. Complete the details in the Create an Application Process dialog box, and then click Save.

Result

The **Design** tab page for the application process that you created is displayed.

k. Select the component process from the left pane and drag it into the design area.

Note: You can click the Edit icon to add the properties, if required.

- I. Click Save in the design area.
- 11. Select the application process to run the test by completing the following steps:
 - a. Click Applications from the UCD dashboard.
 - b. Click the application that you configured for a test run.
 - c. Click the **Request Process** icon

Result

The Run Process on <environment name> window is displayed.

- d. Select the application process that contains the test from the **Process** list.
- e. Click Submit.

Result

The UCD dashboard shows the progress of the application process request.

Results

You have used the IBM® Rational® Test Automation Server UCD plugin to integrate Rational® Test Automation Server with UCD and run the test from your project on the UCD server.

After the UCD process request runs successfully, you can view the status of the completed process request displayed as follows:

- Success: When the test run is successful
- Failed: When the test run is failed

What to do next

- You can view the details of the test run as a process from the UCD dashboard by performing the following action:
 - Expand the *step*. You can then expand the application process. You can then hover over the process, and then click the **Output Log** icon . The output log is displayed. You can verify the log details.
- You can also view the test reports and logs of the test that was run on the UCD server from the Results page on IBM® Rational® Test Automation Server. See Test results and reports overview on page 268.

Managing access to IBM® Rational® Test Automation Server

Desktop clients and third-party integrations use offline user tokens to connect to Rational® Test Automation Server.

You can configure the desktop clients and third-party integrations to access Rational® Test Automation Server by using the offline user tokens created from the server.

Offline user tokens are used in the following cases:

- To retrieve secrets configured on the server to be used in certain tests in Rational® Integration Tester
- To enable publishing of test results and reports from desktop clients to Rational® Test Automation Server
- To enable the Resource Monitoring Service in Rational® Performance Tester to monitor a data source during a run on Rational® Test Automation Server
- To enable third-party integrations.

About this task

From Rational® Test Automation Server, you can create an offline user token, copy it, and then use that token in each of the desktop clients and third-party integrations.

You can also delete all the tokens, when you no longer need access or you want to prevent access to the server.

Creating a token

- · Follow these steps:
 - 1. Click the **User** icon from the menu bar and select **Create Token**.

The Create Offline User Token dialog box is displayed.

Note: This token is not accessible after you copy it as the dialog box closes.

2. Copy the token and paste it into a private location for ongoing reference.

The dialog box closes.

3. Paste the token into the desktop client UI or the third-party integrations UI where this token is required.

See the following table for a list of where you can use the tokens and where you can find more information.

Table 9. Using the offline user tokens to access Rational® Test Automation Server

Use the offline user token in the following places

More information

Rational® Integration Tester See Rational® Integration Tester and Rational®

Test Automation Server.

Rational® Performance Tester See Publishing test results to the server.

Use the offline user token in the following places	More information
	See Enablement of Resource Monitoring services
	for a schedule.
Rational® Functional Tester	See Publishing test results to the server.
Third-party integrations	See Integrating with other applications on
	page 310.

Deleting tokens

- Follow these steps:
 - 1. Click the **User** icon from the menu bar and select **Delete Tokens**.

The Delete All Offline User Tokens dialog box is displayed.

2. Inform the desktop client users that the tokens were deleted. Fix any test automation scripts that used tokens.

Chapter 7. Test Manager Guide

This guide describes how to manage and track your overall test effort. This guide is intended for test managers.

Managing access to server projects on page 369

Team space management

You might want to become a team space member, add members to your team space, change a user role in a team space, modify the team space, or delete a team space.

Each team space is associated with at least one *Team Space Owner*. You can assign multiple owners to your team space. Any user who becomes a member of a team space and is assigned the role of a *Member, Project Creator, Architect*, or *Team Space Owner* of a team space, can access the team space.

As an owner of a team space, after you create a team space, you must configure the team space license. You can then add members to the team space and can assign different roles to each member of the team space. You can update or delete a team space. You can also add a repository to a team space to store a system model and edit the repository settings. Apart from adding a repository, you can add, update, or delete the Resource Monitoring agent if no longer required.

As an Architect of a team space, you can manage a team space repository and design a system model.

As a Project Creator of a team space, you can create a project in the team space.

As a licensed user who is assigned with a *Member, Project Creator, Architect*, or *Team Space Owner* role of a team space, you can add a Docker host to your team space. You can view the configured Docker, agents, or intercepts of your team space. You can edit only those Docker hosts that you created.

Viewing team spaces

After you log in to IBM® Rational® Test Automation Server for the first time, you can view all the existing team spaces on the **Team Space Dashboard** page.

About this task

As a member of a team space, you can view your team spaces under **My Team Spaces**. You can also view the team spaces that are created by other users as the public team space and the Permissive team spaces under **Other Team Spaces**.

If the initial team space does not exist, then you can view the Team Space Dashboard without any navigation pane.

You as a member of a team space, when you want to use that team space immediately after you log in to Rational® Test Automation Server, you can suffix the alias in the application URL.

For example, if the alias of the team space is first, then you must use the following Rational® Test Automation Server URL in the address bar:

<server url>/#/first

Log in to Rational® Test Automation Server.

Result

The **Projects** page of the initial team space is displayed.

You can view the team spaces in the following panels:

- My Team Spaces: You can view all the team spaces that you created. You can also view the team spaces in
 which you are a member.
- Other Team Spaces: You can view all the team spaces that are created by others.

Note: You cannot view the Restrictive private type team spaces.

Results

You have viewed the team spaces that are created by you and other users on the Team Space Dashboard.

What to do next

You can select a team space and can send a request to become a member of that team space. See Becoming a team space member on page 357.

Adding members to a team space

When you create a team space to manage projects, you must add users to your team space so that they can create and access the projects.

Before you begin

- As an administrator, you are assigned the default role of a *Team Space Owner*. If you log in to Rational® Test Automation Server as another user, then you must have been assigned the role of a *Team Space Owner*.
- As an owner of a team space, you must have configured a license for the team space. See Configuring floating licenses on page 87.

You must have been assigned a role as a *Team Space Owner*. If you are a server administrator, then you are assigned with the default role of a *Team Space Owner*.

About this task

As an owner of a team space, you can add multiple users to your Permissive or Restrictive team space.

1. Log in to Rational® Test Automation Server.

Result

The **Projects** page of the initial team space is displayed.

2. Click Dashboard.

Result

The **Team Space Dashboard** page of the initial team space is displayed.

Note: If the initial team space does not exist, then you can view the **Team Space Dashboard** page without any navigation pane.

- 3. Identify the team space for which you want to add the members.
- 4. Click the **Settings** icon **②**.

Alternatively, click Manage > Configuration in the navigation pane.

Result

The **Team Space Configuration** page is displayed.

- 5. Click the Details tab.
- Enter a user name in the Add People field on the to add users.Alternatively, you can find the user name by using type search.

Result

The list of users is displayed.

- 7. Select the user.
- 8. Assign a role to the selected user.

Note: All members are assigned the default roles of a Project Creator and Architect.

You can choose the role for the user based on its associated actions:

Roles	Responsibilities
Team Space Owner	∘ Create a team space.
	∘ Update and delete a team space.
	∘ Add members to a team space.
	 Remove members from the team space.
	∘ Assign role to the members.
	Modify roles of the members.
	∘ Create and modify a project.
	∘ Add or update the system model.
	 Add a repository to store a system model.
	 Update and delete a repository in a team space.
	∘ Add, update, or delete Docker.
	 Configure or update agent and intercepts.
	 Register, update, delete, and list Resource Monitoring sources in a team
	space.

Roles	Responsibilities
Project Creator	∘ Create, update, and view a project
	∘ Add, update, or delete Docker.
	Configure or update agent and intercepts.
Architect	 Create, update, delete, and view a repository in a team space.
	 Create, update, and delete components in the system model.
	∘ Add, update, or delete Docker.
	Configure or update agent and intercepts.
Member	 View the list of team spaces in the Team Space Dashboard.
	 View the configuration of the team space.
	∘ Add, update, or delete Docker.
	 Configure or update agent and intercepts.
	 View the registered Dockers, agents, or intercepts.
	 View the Resource Monitoring agents in a team space.
	 View the registered Resource Monitoring agents.
	View components in the system model.

- The members with the assigned role of a *Team Space Owner, Project Creator, Architect,* or *Member* of a team space can be assigned with any of the following project roles:
 - Project Owner
 - Tester
 - Viewer
- You can add or remove the role of a member by using the **Menu** icon * next to each user in the **Members** list.
- 9. Repeat the applicable steps to add another user.

Results

You have added members with assigned roles to your team space. You can view the list of all added users on the **Team Space Configuration** page.

What to do next

You can reassign or remove the roles of users to one or more team spaces that you own. See Managing members and their roles in a team space on page 358.

All users can request to be a member of another team space. See Becoming a team space member on page 357.

Users added as members to the team space can view the team space in My Team Spaces.

Modifying the configuration of a team space

After you create a team space, if you want to modify the details of the team space, add a repository to your team space, or delete a team space, then you can perform these tasks on the **Team Space Configuration** page.

Before you begin

You must have been assigned the role of a Team Space Owner.

About this task

The **Team Space Configuration** page displays details of the team space.

As an owner of a team space, you can modify details of the team space, add members to your team space, and assign roles to the members of the team space on the **Team Space Configuration** page.

The Team Space Owner and Architect can add or remove a repository from the team space.

If the team space is no longer required, then the Team Space Owner can also delete that team space.

As a *Member, Project Creator*, or *Architect*, you can only view the configuration details of a team space on the **Details** tab of the **Team Space Configuration** page.

As a *Member*, and *Project Creator* you can only view the configuration details of a team space on the **Repository** tab of the **Team Space Configuration** page.

1. Log in to Rational® Test Automation Server.

Result

The **Projects** page of the initial team space is displayed.

2. Click Dashboard.

Result

The **Team Space Dashboard** page is displayed.

- 3. Select the team space that you want to modify from My Team Spaces.
- 4. Click the **Settings** icon Of the selected team space.

Result

The **Team Space Configuration** page is displayed.

5. Perform the modifications on the following details of the **Details** tabs of the team space:

Fields	More information
Name	Name of the team space.
URL alias	An alias of the team space. Suffix the alias in the application URL to access a specific team space after you log into the application.
Available at	Displays the application URL by using an alias. You can copy this URL and use it when you want to ac-

Fields	More information
	cess the team space immediately after you log in to the application.
Member Access	Access to a team space based on the type of the team space. The team space can be of the following types: • Permissive: All licensed users can access this team space without the approvals of a Team Space Owner. • Restrictive: All licensed users must get approvals from the Team Space Owner to access this team space.
Visibility	The visibility mode of a team space can be of the following types: Public: The team spaces are visible to all licensed users in the Other Team Spaces panel. Private: The team spaces are not visible to all the licensed users in the Other Team Spaces panel. Note: The visibility mode is available only when the Restrictive type of team space is selected.
Description	Brief description of the team space. This is an optional field.
Add People	List of members in a team space.

 ${\it 6. Click the \mbox{\bf Repository} tab\ to\ modify\ the\ details\ of\ the\ repository\ of\ the\ team\ space.}$

Results

You have modified the configuration details of the selected team space.

What to do next

You can add members and assign roles to each member of your team space.

Related information

Adding members to a team space on page 350

Managing members and their roles in a team space on page 358

Viewing the configuration of a team space

You can view the configuration of a team space as a member of any team space. You can view the configuration details on the **Team Space Configuration** page.

Before you begin

You must be a member of a team space.

About this task

The **Team Space Configuration** page displays the configuration details of the team space.

As a member of a team space, if you want to access your team space immediately after logging into IBM® Rational® Test Automation Server, then you must suffix the alias in the application URL. You can find details of the alias on the **Team Space Configuration** page. You can also view the list of members and their roles in that team space on the **Team Space Configuration** page.

- 1. Log in to Rational® Test Automation Server.
- 2. Click Dashboard.

Result

The **Team Space Dashboard** page is displayed.

- 3. Identify the team space for which you want to view the configuration from My Team Spaces.
- 4. Click the **Settings** icon of the team space.

The **Team Space Configuration** page is displayed.

You can view the following details about the team space:

Fields	Tabs	More information
Name	Details	Displays the name of the team space.
URL alias	Details	Displays an alias of the team space. You must suffix this alias in the application URL to access a specific team space after you log in to the application.
Available at	Details	Displays the application URL by using an alias. You can copy this URL and use it when you want to ac-

Fields	Tabs	More information
		cess the team space immediately after you log in to the application.
Member Access	Details	Displays the type of team space that defines the permissions to access the team space. A team space can be of the following types: • Permissive: All licensed users can access this team space without the approvals of a Team Space Owner. • Restrictive: All licensed users must get approvals from the Team Space Owner to access this team space.
Visibility	Details	The visibility mode of a team space can be of the following types: Public: The team spaces are visible to all licensed users in the Other Team Spaces panel. Private: The team spaces are not visible to all the licensed users in the Other Team Spaces panel. Note: The visibility mode is available only when the Restrictive type of team space is selected.
Members	Details	Displays a list of members of the team space.
Repository	Repository	Displays the repository details that host the system model.

Results

You have viewed the configuration details of the selected team space.

Becoming a team space member

After logging into IBM® Rational® Test Automation Server, the licensed users must be a member of any team space to perform test activities in a project. As a licensed user, if you are not assigned the role of a member in any team space, then you can request the *Team Space Owner* to become a member of any existing team space.

Before you begin

You must be a licensed user.

About this task

If you want to become a member of a **Restrictive** team space, then only the owner of that team space can grant you the role of a member of a team space. If you request to become a member of a **Permissive** team space, then you automatically become a member of that team space.

Note: The server administrator can join any team space automatically without any approval and is assigned with a default role of *Team Space Owner*.

1. Log in to Rational® Test Automation Server.

Result

The Projects page of the initial team space is displayed.

2. Click Dashboard.

Result

The Team Space Dashboard page is displayed.

3. Select the team space that you want to join from the list of other team spaces in the Team Space Dashboard.

Note:

You can view only the public type of **Restrictive** team spaces and the **Permissive** team spaces.

- 4. Click the **Key** icon P of the selected team space.
- 5. Confirm your request when prompted.

If you agree, then the Team Space Owner sees a notification about the request.

After opening the notification, the *Team Space Owner* can view the user who is requesting the access and can accept or decline the request. If the *Team Space Owner* accepts your request, you are added and assigned a *Member* role.

Notes:

- You can become a member of any team space only when the license of the selected team space is configured.
- If you are a server administrator, then the Team Space Owner role is the default role assigned.
- If you are a licensed user, then the Member role is the default role assigned and is restricted to specific actions.

You can then see the team space under My Team Spaces on the Team Space Dashboard page.

You might want to follow up with the Team Space Owner if your request is pending for some time.

Results

You have become a member of another team space.

What to do next

You can view the actions that you can perform based on your assigned role. See Adding members to a team space on page 350.

Managing members and their roles in a team space

After you assign roles to the members of a team space, as a *Team Space Owner*, you might want to remove a member from the team space or reassign the role to the existing members of your team space.

Before you begin

You must have been assigned the role of a Team Space Owner.

About this task

As a licensed user, you are assigned a role of a *Member* in any team space after the approval of the *Team Space Owner*.

As an owner of a team space, you can remove or reassign any member of your team space with the roles of a *Team Space Owner*, *Project Creator*, or *Architect*. You can also remove any member from the list of members of the team space.

1. Log in to Rational® Test Automation Server.

Result

The **Projects** page of the initial team space is displayed.

2. Click Dashboard.

Result

The **Team Space Dashboard** page is displayed.

- 3. Identify the team space for which you want to reassign the roles of the members or remove a member from the list of members.
- 4. Click the **Settings** icon O of the identified team space.

Result

The **Details** tab of the **Team Space Configuration** page is displayed.

- 5. Identify the member from the list of **Members**.
- 6. Click the **Menu** icon next to the selected member.
- 7. Perform any one of the following operations to the identified member of the team space:

Choose from:

- Click **Remove Member** to remove the identified member from the team space.
- \circ Select the role that you want to assign or remove the assigned role for the identified member.

You can choose multiple roles for the members based on the associated actions:

Roles	Actions
Team Space Owner	Create a team space.
	 Update and delete a team space.
	 Add members to a team space.
	 Remove members from the team space.
	 Assign role to the members.
	 Modify roles of the members.
	 Create and modify a project.
	 Add or update the system model.
	 Add a repository to store a system model.
	 Update and delete a repository in a team space.
	 Add, update, or delete Docker.
	 Configure or update agent and intercepts.
	 Register, update, delete, and list Resource
	Monitoring sources in a team space.
Project Creator	Create, update, and view a project.
	 Add, update, or delete Docker.
	 Configure or update agent and intercepts.
Architect	Create, update, delete, and view a reposi-
	tory in a team space.
	Create, update, and delete components in
	the system model.
	 Add, update, or delete Docker.
	 Configure or update agent and intercepts.
Member	View the list of team spaces in the Team
	Space Dashboard.
	 View the configuration of the team space.
	 Add, update, or delete Docker.
	 Configure or update agent and intercepts.

Roles	Actions
	View the registered Dockers, agents, or in-
	tercepts.
	 View the Resource Monitoring agents in a
	team space.
	View the registered Resource Monitoring
	agents.
	View components in the system model.

Note: The *Team Space Owner, Project Creator, Architect,* or *Member* of a team space can be assigned with any of the following project roles:

- Project Owner
- Tester
- Viewer

Similarly, you can remove the assigned role of any member of your team space.

Results

You have completed any of the following tasks in your team space:

- Reassigned the role of the members.
- Removed the assigned role of the members.
- · Removed the members.

Related information

Adding members to a team space on page 350

Deleting a team space

You might want to delete a team space when it is no longer needed.

Before you begin

You must have been assigned the role of a Team Space Owner of IBM® Rational® Test Automation Server.

About this task

As a *Team Space Owner*, you can delete a team space that you do not need. When you delete a team space, it is a permanent deletion. You cannot undo the delete action on a team space.

When you delete the initial team space, you can only view the **Team Space Dashboard** page without any navigation pane.

After you delete the team space, you can use the name of the team space again.

1. Log in to Rational® Test Automation Server.

Result

The **Projects** page of the initial team space is displayed.

2. Click Dashboard.

Result

The **Team Space Dashboard** page is displayed.

3. Click Manage > Configuration.

Result

The **Team Space Configuration** page is displayed.

- 4. Click the Details tab.
- 5. Click Delete Team Space.
- 6. Confirm that you want to delete the team space when prompted.

If you proceed, the team space is deleted including all of its projects and members.

Results

You have deleted the selected team space.

What to do next

You can view the available team spaces on the **Team Space Dashboard** page. See Viewing team spaces on page 349.

After you delete a team space, the license that is used for that team space is released and is available to configure the other team spaces, if required. See Configuring floating licenses on page 87.

Test assets and a server project

Rational® Test Automation Server projects manage access to your test assets, which are stored in a Git repository. Projects are either public by default or private. Private projects are not discoverable by other users. You can either add your own project or you can request to be a member of another public project.

When you add your own project, you can configure it now or later. Configuring the project includes adding details about the project, adding one or more Git repositories, optionally adding secrets, classifying encrypted datasets, and adding a change management system. To run test assets that are associated with an encrypted dataset, you must categorize the encrypted datasets by creating a classification. You can also add users to your server project so they can access your test assets. To use Jira to create defects for the tests available in your project, you must configure the Jira server for your project on Rational® Test Automation Server.

Working with projects

After you log in to IBM® Rational® Test Automation Server, you must have a project to perform the test activities. To work with projects, you must create and configure projects.

Before you begin

You must have logged into Rational® Test Automation Server.

- 1. Go to the **Projects** page from the Home page of the initial Team Space. See Viewing projects on page 367.
- 2. Add a project. See Adding a project on page 364.
- 3. Add a repository. See Adding a repository to a team space on page 111.
- 4. Add secrets in secrets collections. See Secrets configuration on page 366.
- 5. Encrypt the data set resources. See Data security.
- 6. Configure a change management system. See Change management system.
- 7. Add members to a project and configure their roles. See Adding users to a server project on page 366.
- 8. View the test assets or resources maintained in the repositories. See Test resource access by using the global branch
- 9. Perform the following tasks based on the type of test assets or resources that you want to run:
 - a. Add agents to your project, if you are using remote agents as a location to run certain tests. See Adding an agent to a project on page 142.
 - b. Add remote Dockers, if you are using a remote Docker host as a location to run tests. See Adding a remote Docker host to the project for running tests on page 156.
 - c. Read the considerations that you must take into account before you configure a run or start a virtual service. See Prerequisites for running virtual services on page 227.
 - d. Read the considerations that you must take into account before you configure a test run. See Prerequisites to running tests on page 133.
- 10. Configure a run of the test asset or resource. See Test run configurations on page 162.
- 11. View the progress of a test run. See Viewing the progress of running test assets on page 218.
- 12. Manage a running test. See Management of running tests on page 218.
- 13. View the results of a test run after the run is completed. See Test results on page 267.
- 14. Review the test results and create defects for test runs from the Results page. See Creating Jira defects on page 308.

Results

You have successfully performed all the tasks with the projects.

Repository considerations for a server project

To collaborate with other project stakeholders, you can open test assets from a local clone of the Git repository, pull project test assets from a Git repository, and push changes made to your local test assets to a Git repository. Before you add a project and add a repository to that project, you must consider some information about repositories.

Consider the following sections about using Git repositories with IBM® Rational® Test Automation Server. For more information about installing, setting up, and using Git, see the Git documentation.

Git

You must install Git or upgrade the version if you already have installed Git.

Repositories and user identities

After you install Git, you must set up your Git repository and set up access for members. You must ensure that the repository contains your test assets.

Optionally, you can use a command line utility or Git tool to access the repository, upload your test assets, fetch or pull from the repository, push to the repository, clone the repository, and other operations you want to perform in Git.

Local and shared repositories

After you create a remote or shared repository in Git, you can create a local version of the repository by cloning the remote repository. You must ensure that your test assets are available in the remote repository and are also cloned to the local repository.

Alternatively, if your test assets are on your local system, you can set up a Git repository in the bare mode, add the project files to the local repository, and then commit and push from the local repository to the remote repository in Git by using your preferred method.

Note: While copying the test assets from your local system to the repository, you must ensure that you copy the entire project that contains the test assets.

User authentication for the Git repository

The administrator can set up different types of authentication for accessing the Git repository. Rational® Test Automation Server supports the following authentication types:

- HTTP with user name and password
- · HTTP without user name and password
- HTTPS with user name and password
- HTTPS without user name and password
- · SSH with SSH key and passphrase
- · SSH with SSH key and without a passphrase

Based on the authentication type that is set for a repository, you must provide the same authentication values in Rational® Test Automation Server when you add a repository.

Test assets

You must complete the following tasks in the desktop client where you are authoring your test before you check in and commit the test assets to the Git repository.

Test type	Task	More information
API suite in Rational® Integration Tester	Change the local stub to a remote stub.	See Test run considerations for API Suites on page 134.
	Add the library files.	

Adding a project

The first step is to add a project and provide some details about it.

Before you begin

To add one or more projects to manage access to your test assets, you must log in to IBM® Rational® Test Automation Server by providing the application URL in a browser.

If you are a new user, and LDAP and Active Directory are not configured, you must first sign up by completing a form that specifies user information such as an email, user name, and password, then you can log in by using that information.

About this task

You add a project and give it a name and description.

- 1. Log in to Rational® Test Automation Server.
- 2. From the Home page, add a project. Give it a name and if you want, add a description. The Details page is displayed.
- 3. Decide if you want a public project, which is the default, or a private project.

What to do next

You can add a repository to your project.

Related information

Default user administration on page 58

Adding repositories to a server project

You can add repositories to a server project to access the test assets available in the respective repository.

Before you begin

You must have completed the following tasks:

- Added a project on IBM® Rational® Test Automation Server.
- Been granted permission to access the repository.

About this task

As a project owner or a tester, you can add one or more repositories to your project. When you add a repository, the Git repository is cloned to your project. While adding a repository, you must provide the necessary authentication credentials that are set for the Git repository that you want to add to your project. For example, if the authentication type is SSH, then you must provide the Git URL, a deploy key, and a passphrase.

After you log in, from the Home page, you can add one or more repositories to your project by following these steps.

- 1. Open your project.
- 2. Click the Repositories tab.
- 3. Click Add repository.

The Add repository page is displayed.

- 4. Enter the URL of the Git repository that you want to add to your project.
- 5. Click the **Expand** icon to enter the required credentials based on any of the following authentication methods configured in the repository.

To gain access to the repository, you must use any one of the authentication methods:

Authentication method	Credentials required
SSH	∘ Deploy key ∘ Passphrase
HTTPS	∘ User name ∘ Password
НТТР	∘ User name ∘ Password

Notes:

- You must have defined the authentication type and set the authentication credentials in the Git repository.
- If you use SSH to connect to your remote repository and Rational® Test Automation Server displays an Auth Fail exception while using the deliver changes option, you can resolve this exception error by regenerating your SSH keys by using the -m PEM option.
- 6. Click Add.

The Git repository is cloned on Rational® Test Automation Server.

Note: Depending on the size of the repository you are cloning, it can take a few to several minutes to clone the repository.

7. Optional: Repeat the steps to add another repository.

What to do next

You can perform the following actions on the repository that you added:

- · Update the authentication credentials if they are changed in the Git repository configuration.
- Delete a repository if it is no longer required.
- Refresh a repository to fetch and synchronize changes from the remote repository.
- Configure a webhook to notify the server there is a push event in the remote repository.
- Add a system model to the repository.

Secrets configuration

If you are working with an API suite and the project test asset contains environment variables that are required for the test runs, you must configure the environment variables as secrets in a secrets collection by using the **Secrets** tab. Configuring secrets enable the API suite to run correctly on Rational® Test Automation Server.

Related information

Protecting API test assets by using secrets on page 377

Adding users to a server project

You can add users to your server project so they can access your test assets.

Before you begin

You own a project.

About this task

As a project owner, you can add other users to your public or private project. For example, if you have a large number of test assets that must be run, you might want your test team to help run them, and see the results.

- 1. Add one or more users to be members of your project. Click the **Settings** icon on the Project card in the list of **My Projects** or click **Configure** in the navigation when the project is already open.
- 2. Add users by entering the user name of the user you want to add. You can add a partial name and then press **Enter** to see the user that you want to add.
- 3. Select that user and then assign a role. Click **Viewer**, **Tester**, or **Owner**. When you add a user, the default role is Viewer.

The added user after logging in can see the owner's project in their list of My Projects.

4. Repeat the applicable steps to add another user.

What to do next

You can add or remove roles to one or more projects that you own. All users can request to be a member of another public project.

Related information

Becoming a project member on page 368

Managing access to server projects on page 369

Viewing projects

After you log in to IBM® Rational® Test Automation Server, you can view the existing projects in the initial Team Space.

About this task

As a project owner, you can view your projects under the **My Projects** panel, and the projects that are created by other users as public projects are displayed under the **Other Projects** panel.

Log in to Rational® Test Automation Server.

The **Projects** page of the initial Team Space is displayed.

You can view the following projects:

- The projects that you created or were added to as a member with either the *Tester* or *Viewer* role are displayed under the **My Projects** panel.
- The projects that are created by others as public projects are displayed under the Other Projects panel.

Results

You have viewed the projects that are created by you and other users in the Team Space.

What to do next

You can perform any of the following tasks:

- Create a project. See Adding details to a server project on page 364.
- Request to become a member of a project that is displayed under the Other Projects panel. See Becoming a
 project member on page 368.
- View the other pages in the Team Space and perform tasks on those pages. See Tasks or operations in a Team Space on page 78.

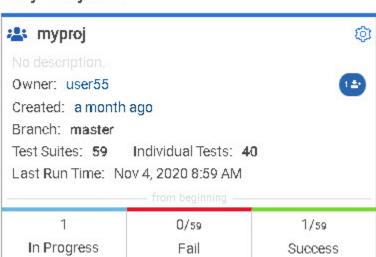

Becoming a project member

You might want to request to be a member of another project. New users without any projects might also want to be a member of an existing project.

About this task

As a project owner, you can add users to your public or private projects. All users can request to become a member of a public project.

- 1. Request to be a member of another project. Search for the project that you want to join in the list of other projects from the project Home page. Click that Project card or the **Key** icon ?. Only public projects are visible in the list of projects.
- 2. Confirm your request when prompted. If you agree, the project owner is notified. The project owner sees a pending request **Notification** icon on their Project card.

My Projects

After opening the notification, the owner can see the user that is requesting access and can accept or decline it.

If the project owner accepts your request, you are added as a member of the project with a Viewer role. A Viewer role is the default role assigned and is restricted to specific actions.

You then see the project under My Projects on the Home page.

If the project owner declines your request, follow up with the project owner.

Managing access to server projects

You might want to add or remove a project member role from your project.

About this task

As a project owner, you can assign access by specifying a role when you add a user to your project. You can also assign more access or remove access for a user. Roles enable users to perform tasks on project resources such as running tests and viewing test results.

1. Choose the role in a project based on its associated actions.

Option	Description
Owner of a project	· All Tester's actions
	 Update, archive, list, and view a project
	 Assign, update, delete, and list user roles for a project
	Accept new member requests
	 Create, update, and delete a dataset classifi- cation in a project
	Add, update, and remove an encrypted dataset from a classification
	 Update current row for a listed dataset in a project
	∘ Delete, list and view a report
	 Update, delete, and list a repository in a project
	 Get the test assets from a repository in a project
	 Create, update, delete and list secrets in a project
	 Create, update, delete, and list resource monitoring sources in a project
	• Get the content of a resource monitoring
	source in a project
	 Register, update, delete, and list resource monitoring agents
	 Create, configure, and delete the Jira change management system

Option	Description
	 Create and update defects in the Jira change management system Create and update components in the system model
Tester of a project	 All Viewer's actions List repositories in a project Run a test and create a report Stop a test while running Get the test assets from a repository in a project Get a list of datasets in a project Get the content of a dataset Update the current row for a listed dataset in a project Add, update, and remove an encrypted dataset from a classification Delete a report if you created the report Create and update defects in the Jira change management system Create and update components in the system model
Viewer of a project	 List your own roles on a project List running tests List and view a report List resource monitoring sources in a project Get the content of a resource monitoring source in a project List the resource monitoring agents View components in the system model View defects in the Jira change management system
Non-member of a project	• Request to be a member of a project

2. Open the project that you own.

From the project details, you can see a list of project members for your project and then add or remove a members role.

3. Add or remove the member access by using the **Menu** icon next to each user in the member list.

Archiving or unarchiving server projects

You can archive a project when that project is no longer needed but you want to retain it for future reference. If you do want to use an archived project, you can unarchive it.

About this task

As a project owner, you can archive projects that are inactive. Archived projects are not visible to users or project members, but owners can show or hide their archived projects. Archived projects can be unarchived.

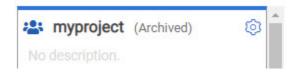

Note:

After you migrate the server data from a previous version to a newer version, the **Project Owner** must log in to Rational® Test Automation Server so that other members of the project can access the test assets in that project.

- · Archive a project by following these steps:
 - 1. Open the project that you want to archive.
 - 2. From the project details, archive the project.
 - 3. Confirm that you want to archive the project when prompted. If you proceed, the project is archived and is hidden in your project list. To show or hide the archive projects, select the appropriate option by using the **Menu** icon from the menu bar.

When visible, the archived project shows as archived in the list of My Projects.

Note: The option to configure a project continues to display after you archive a project.

- Unarchive a project by following these steps:
 - 1. Open an archived project and unarchive it.
 - 2. Confirm that you want to unarchive the project when prompted. If you proceed, the project is unarchived and is shown in your project list.

Deleting server projects

You might want to delete a project when the project is no longer needed, and you want to free up disk space.

About this task

As a project owner, you can delete a project that you no longer want. When you delete a project it is permanent. You cannot undo the delete project action.

After you delete the project, you can use the project name again.

- 1. Open the project that you want to delete.
- 2. From the project details, delete the project.
- 3. Confirm that you want to delete the project when prompted. If you proceed, the project is deleted including all of its test assets, results, and members.

Note: The repository that you used for the project is not deleted.

An overview of test assets, modifications, and scheduled runs

After you configure a project with one or more Git repositories and run some test assets, you can view statistics about those test assets.

From the **Overview** page, several cards display charts, sliders, and tables of the statistics of the test assets in your server project. You can click some of the charts, sliders, or tables to see more information, such as the progress of a scheduled run or the results of a run. You can also review some statistics by date and see more details such as the proportion of test assets by type.

You can view a server project, which might contain multiple repositories and multiple branches, by selecting the name of the branch from the **Branch** drop-down list. For more information about selecting branches, see the related links.

Test suites

This card displays a slider of the percentage of test suites by type. A test suite is a collection of tests, including schedules, compound tests, API Suites, and AFT Suites. You can hover over the slider and see the proportion of test suites by test suite type. The number of suites shown are relative to the selected branch.

Individual tests

This card displays a slider of the percentage of individual tests by type that are used in the test suites. You might have performances tests, API tests, or UI tests according to the desktop clients that you used to create the tests. You can hover over the slider and see the proportion of individual tests by type. The number of tests shown are relative to the selected branch.

Execution results

This card displays a chart of the proportion of test suites that were run by status and by date. If no date is selected, the card displays all the run results associated with the project since it was created. You can see the run results by clicking a test suite status. You can also hover over the chart and see the test suite status and the proportion of test assets. You can view statistics by test suites run.

- The results shown are generated from test suites run.
- · The statistics exclude canceled test suites.

- The number of test suites and individual tests that are associated with your project are shown on the **Home** page along with a verdict summary. You can see the run results by clicking a verdict. You can also see the last date and time when you ran one or more test assets.
- The number of suites shown are relative to the selected branch.

Last run

This card displays a table of the last three runs by date and time. You can see the run results by clicking each last run.

New or modified

This card displays a chart of new and modified test assets that were made in your Git repository for a week or for the last seven days based on a selected date range. You can hover your mouse over each bar in the chart and see the proportion of test assets by type. The data shown is relative to the selected branch.

Scheduled runs

This card displays a table of the next three scheduled runs by date and time. You can see the progress of a scheduled run by clicking each scheduled run.

Test resource access by using the global branch

Managing repositories

After you create a project in Rational® Test Automation Server, you can add repositories that contain test assets and resources to the project. You can also change the repository details, update the user credentials of a repository, delete a repository, create a webhook for the configured repository.

Tasks in a repository

To add a repository in your project and work on the repository, you can perform the tasks listed in the following table:

Task	More information
Adding a repository	Adding repositories to a server project on page 364
Deleting a repository	Deleting a repository on page 375

Adding repositories to a server project

You can add repositories to a server project to access the test assets available in the respective repository.

Before you begin

You must have completed the following tasks:

- Added a project on IBM® Rational® Test Automation Server.
- Been granted permission to access the repository.

About this task

As a project owner or a tester, you can add one or more repositories to your project. When you add a repository, the Git repository is cloned to your project. While adding a repository, you must provide the necessary authentication credentials that are set for the Git repository that you want to add to your project. For example, if the authentication type is SSH, then you must provide the Git URL, a deploy key, and a passphrase.

After you log in, from the Home page, you can add one or more repositories to your project by following these steps.

- 1. Open your project.
- 2. Click the Repositories tab.
- 3. Click Add repository.

The Add repository page is displayed.

- 4. Enter the URL of the Git repository that you want to add to your project.
- 5. Click the **Expand** icon to enter the required credentials based on any of the following authentication methods configured in the repository.

To gain access to the repository, you must use any one of the authentication methods:

Authentication method	Credentials required
SSH	∘ Deploy key ∘ Passphrase
HTTPS	∘ User name ∘ Password
НТТР	∘ User name ∘ Password

Notes:

- You must have defined the authentication type and set the authentication credentials in the Git repository.
- If you use SSH to connect to your remote repository and Rational® Test Automation Server displays an Auth Fail exception while using the deliver changes option, you can resolve this exception error by regenerating your SSH keys by using the -m PEM option.
- 6. Click Add.

The Git repository is cloned on Rational® Test Automation Server.

Note: Depending on the size of the repository you are cloning, it can take a few to several minutes to clone the repository.

7. **Optional:** Repeat the steps to add another repository.

What to do next

You can perform the following actions on the repository that you added:

- · Update the authentication credentials if they are changed in the Git repository configuration.
- Delete a repository if it is no longer required.
- Refresh a repository to fetch and synchronize changes from the remote repository.
- Configure a webhook to notify the server there is a push event in the remote repository.
- Add a system model to the repository.

Related information

Working with Git repositories

Deleting a repository

You can delete repositories that you no longer require in your test environment.

Before you begin

You must have completed the following tasks:

- Configured the repository that contains the test assets in your project.
- Been assigned a project owner or a tester role with access to delete repositories.

About this task

You can delete a repository that you have configured for your project.

1. Open your project and go to the Repositories page.

You can see a list of repositories that you added to the project.

2. Delete a repository that you want to remove from the project.

The repository is deleted and removed from the list.

Selecting the global branch in a project

After you add one or more repositories to your project, you can start accessing all branches in all repositories of that project. You can select only one branch as a global branch from the list of branches in the **Execution**, **Datasets**, and **Overview** pages.

Before you begin

You must have completed the following tasks:

- Been assigned a member or Project Creator role in a team space
- · Added at least one repository in your project.

About this task

You can access all the branches contained in all the repositories, which are added to the project, by using the **Branch** field on the **Execution**, **Datasets**, and **Overview** pages.

After you select a branch from any of the repositories as the global branch, this selection is retained for you as the global branch unless you change the branch on any of the following pages: **Overview**, **Execution**, or **Datasets** pages.

- When you add the first repository to a project, the global branch is set to the default branch of the repository.
- Branches are arranged in an increasing order of their names in the list.
- When you change the branch in one of the pages, then the same branch is displayed as selected in the other pages and the contents of that page displays the assets from the selected branch.
- 1. Log in to Rational® Test Automation Server and open the team space that contains your project.
- 2. Open the project.

The project **Overview** page is displayed.

- 3. Go to the **Overview** page.
- 4. Select a branch from the Branch field.

The branch that you selected in the **Overview** page is reflected in the **Execution** and **Datasets** pages and the test assets are filtered based on the global branch selection on each of these pages.

Results

You have selected a global branch in a project.

Protecting API test assets by using secrets

Secrets are key-value pairs that are created for your project in IBM® Rational® Test Automation Server under a secrets collection. You can create secrets collections for your project that enable you or members in your project to use secrets at test runtime either in Rational® Test Automation Server or in desktop clients.

The secrets collections in a project in Rational® Test Automation Server has a separate access control list managed by the members with access to the secrets collections. Controlling access to secrets means controlling access to applications and systems under test. The introduction of secrets (under secrets collections) for a project has simplified managing access to separate environments. If a member of a project does not have access to a secret, for example, a server credential then the member cannot accidentally or maliciously run tests against that server. For example, tests that must access the database server by using the server credentials to retrieve stored data can only be run by a member if the access to the secrets is granted.

Note: Secrets and secrets collections are applicable to test assets authored in IBM® Rational® Integration Tester that enable running tests in defined environments. Secrets are not applicable to tests authored in Rational® Functional Tester or Rational® Performance Tester.

As a project member with the *Owner* or *Tester* role, you can create secrets collections in the project. You can grant or restrict access to the secrets collection that you create in the project.

Members with access to a secrets collection can access, edit, or delete the secrets collection in Rational® Test Automation Server and can view secrets, edit secrets, or delete secrets.

Members with access to secrets collections can grant access to or remove the following:

- · Other members added specifically
- · All members with a specific role

Members in the project with the *Owner* or *Tester* role and with access the secrets collection can use the secrets in the secrets collection, in tests at runtime.

If you are configuring a project to run an API Suite with tests that refer to secret values, you must configure the secrets under a secrets collection by using the **SECRETS** tab. You must complete the following tasks:

- 1. Create a secrets collection. See Step 1 on page 378 in Managing secrets collections on page 377.
- 2. Add secrets in the secrets collection created. See Step 1 on page 380 in Creating a secret in a secrets collection on page 379.
- 3. Grant access to project members or member roles, who can access the secrets collection. See Step 1 on page 381 in Granting access to members or member roles on page 380.

Managing secrets collections

You can create secrets in a secrets collection for your project. Secrets are credentials required in certain tests during test runs. Secrets stored in the collection can be used by members to run tests on different environments and

eliminates the need to store secrets in multiple locations. You can opt to edit or delete a secrets collection that you configured for your project any time after you create a secrets collection.

Before you begin

- You must have created a project on Rational® Test Automation Server. See Test assets and a server project on page 361.
- You must have completed the following tasks before you edit or delete a secrets collection:
 - Configured a secrets collection in your project.
 - Created secrets in the selected secrets collection. See Creating a secret in a secrets collection on page 379.
- You must be a member with the Owner or Tester role to create a secrets collection.
- You must be a member with access to the secrets collection to edit or delete the secrets collection. See
 Granting access to members or member roles on page 380.

About this task

You must configure secrets collections in your project so that the members of the project can use secrets contained in a collection during test runs. You can configure secrets so that you can use them in different test environments.

As a member with access to the secrets collection, you can opt to edit or delete a secrets collection configured in a project. For example, you might want to edit the secrets collection name or delete the secrets collection if the testing environment has changed and if secrets that are configured earlier are not required.

- To create a secrets collection, go to Step 1 on page 378.
- To edit or delete a secrets collection, go to Step 4 on page 379.

To create a secrets collection:

- 1. To create a secrets collection while configuring a new project in the Rational® Test Automation Server UI, open the SECRETS tab in the Project Configuration and create a secrets collection. Use Add Collection.
- 2. Alternatively, to create a secrets collection in an existing project, complete the following steps:
 - a. Log in to Rational® Test Automation Server and from the User Interface (UI) open the project listed under **My Projects** for which you want to create a secrets collection.
 - b. Open the Project Configuration page, and then open the SECRETS tab to create a secrets collection.
- 3. Enter a name for the secrets collection as its Identifier.

Tip: You can create a secrets collection that contains secrets for a particular test environment in your project. For example, the secrets collection *test_env* can contain secrets that application testers can use in tests that they run while the secrets collection *dev_env* can contain secrets that application developers can use in tests they run.

A message is displayed for the successful creation of the secrets collection.

The secrets collection created is displayed.

You can add secrets to the secrets collection you created.

To edit or delete a secrets collection:

- 4. Log in to Rational® Test Automation Server and from the UI open the project listed under My Projects.
- 5. Open the secrets collection from the **SECRETS** tab in the Project Configuration page. If there are multiple secrets collections in the project, select the secrets collection that you want from the list.
 - To edit a secrets collection, go to Step 6 on page 379.
 - To delete a secrets collection, go to Step 7 on page 379.
- 6. To edit a secrets collection, complete the following steps:
 - a. Click the **Edit** icon to edit the selected secrets collection.

Note: The **Edit** icon ? is displayed only for the project owner.

b. Edit the name of the secrets collection, and update the secrets collection.

The secrets collection is updated with the updated name.

7. To delete a secrets collection, click the **Delete** icon to delete the selected secrets collection.

The selected secrets collection is removed from the list of secrets collections configured for the project.

Results

You have completed the following tasks:

- Created a secrets collection for your project.
- Edited the name of a secrets collection in your project.
- Removed a secrets collection from your project.

What to do next

- If you have created a new secrets collection, you must add secrets to your secrets collection.
- You must provide access to project members or member roles to the secrets collection by selecting members or member roles.

Creating a secret in a secrets collection

You must create secrets in the secrets collections configured in your project so that the secrets contained in a collection can be used in certain tests by members of the project with access to the secrets collections during an API suite run.

Before you begin

You must have created a project on Rational® Test Automation Server and configured a secrets collection in your project.

You must be a member with access to the secrets collection.

About this task

You can also configure secrets such that the secrets can be used across different test environments by members with access to the secrets collection. Secrets correspond to the environment variables or tags that you create in a Rational® Integration Tester project specific to an environment.

- To create a secret under a secrets collection while configuring a new project in the Rational® Test Automation Server UI, select the secrets collection listed in the SECRETS tab in the Project Configuration page and create a secret under the secrets collection.
- 2. Alternatively, to create a secret under a secrets collection in an existing project, complete the following tasks:
 - a. Log in to Rational® Test Automation Server and from the UI open the project listed under My Projects.
 - b. Open the secrets collection from the **SECRETS** tab in the Project Configuration page.
- 3. Enter a name for the secret as its *Identifier* and enter the password as the *Value* for the secret.
 For example, under the secrets collection (named as test_env), enter the name of the secret to access a database as dbcred and enter the password required to access the database as its value.

A message is displayed for successful creation of the secret.

Results

You have created secrets in the selected secrets collection for your project.

What to do next

- You can view, edit, or delete the secrets created under a secrets collection any time you want.
- You can use the secrets in the tests that require these secrets during test runs.

Granting access to members or member roles

You can grant or revoke access to the secrets collection in your project to individual members with different roles or the all members with a specific role. Without access to the secrets collection, members cannot view, create, edit, delete, or use the secrets in the secrets collection.

Before you begin

You must have created a project on Rational® Test Automation Server and configured a secrets collection in your project.

You must be a member with access to the secrets collection.

- 1. To grant access to a secrets collection while configuring a new project in Rational® Test Automation Server UI, select the secrets collection listed in the **SECRETS** tab in the Project Configuration page.
- 2. Alternatively, to grant access to a secrets collection in an existing project, complete the following tasks:
 - a. Log in to Rational® Test Automation Server and from the UI open the project listed under My Projects.
 - b. Open the secrets collection from the SECRETS tab in the Project Configuration page.
 If there are multiple secrets collections in the project, select the secrets collection that you want from the list.
- 3. To grant access to a secrets collection in a new project or an existing project, select from the following methods:
 - To add all members with a specific role, click the role listed under Grant access to role. For example, if
 you select Testers, then all members in the project with a tester role are granted access to the secrets
 collection. You can select any role or all the roles listed.
 - To select specific members to grant access to the selected secrets collection, enter the name or the email ID of the member in the field box and add them from the list that is displayed.

Note: Members added specifically are listed under **Members with access to this collection** but all the members granted access solely due to their roles are not listed.

Important: Irrespective of the role that the member (*Owner*, *Tester* or *Viewer*) was assigned in the project, the access to the secrets collections has to be specifically granted to the members from the **SECRETS** tab.

Removing access to a secrets collection

- 4. To remove access granted to all members with a specific role or a specific member, select from the following methods:
 - To remove all members with a specific role, click the role listed under Grant access to role to clear the selection. For example, if Testers is selected and you clear it, then all members in the project with a tester role are removed from the access list to the secrets collection.
 - To remove specific members with access to the secrets collection, select the member and click the
 Delete icon

Notes:

- Any member with access to the secrets collection can remove access of other members specifically added or of all members with a specific role.
- Members with access to the secrets collection can remove themselves from the access list.
 Members can do this when there is at least one member remaining in the list. After removing themselves, members cannot add themselves back to the access list and must be added by any of the other remaining members in the list.

Results

You have added members from your project or members with specific role to the access list of people who can access secrets in the selected secrets collection, or you have removed specific members or members with specific role from the access list.

What to do next

You can create secrets under secrets collections for your project.

Managing secrets

You can view, edit, or delete the secrets configured under a secrets collection any time after you have created secrets or after you were granted access to the secrets collection. You can change the value of the secret by editing the secret. You can delete secrets that you no longer require in your test environment.

Before you begin

You must have created a project on Rational® Test Automation Server and configured a secrets collection in your project.

You must have created secrets in the selected secrets collection or the secrets collection must contain secrets.

You must be a member with access to the secrets collection.

- 1. Log in to Rational® Test Automation Server and from the UI open the project listed under My Projects.
- 2. Complete the following steps:
 - a. Open the secrets collection from the SECRETS tab in the Project Configuration page.
 - b. Optionally, select the secrets collection that you want from the list if there are multiple secrets collections in the project.

The secrets configured in the selected secrets collection are displayed.

3. Complete the steps for the task you want to perform as listed in the following table:

Task	Steps
Viewing a secret val- ue	Click the Show icon ofor the secret you want to view its value, which most likely is a password for the secret.

Task	Steps
	The value configured for the secret is displayed.
Editing a secret value	Click the Edit icon of for the secret you want to edit, and enter a new value for the secret as its <i>Value</i> . The value can be a password for the secret. Note: You can only change the value of the secret. The value of the selected secret is changed.
Deleting a secret	Click the Delete icon in the row of the secret you want to delete.
	After deleting it, the secrets list in the collection is removed from the list.

Results

- You viewed the password configured of the secret under a secrets collection that you created or were granted access.
- You changed the secret value of the secret under a secrets collection in your project.
- · You deleted and removed the secret from the selected secrets collection in your project.

What to do next

You can use secrets in the tests that require these secrets during test runs.

Becoming a project member on page 368

Managing an encrypted dataset

You can use encrypted datasets to limit access to confidential information such as account number or passwords. You can arrange data by an appropriate category so that project members can use datasets more effectively in certain tests and protect them.

About this task

A dataset can contain classified information that other members can access with permission. As a project owner, you can group encrypted datasets into different classifications and enable project members to view and edit datasets and run tests associated with the encrypted datasets. After you have created a classification, you can change the classification for a dataset. You can also delete a classification if you do not require it in your test environment.

- You must grant access and provide an encryption key of an encrypted dataset to other members of the project to work with the encrypted dataset.
- A project member who has been added as a Tester role can work with the encrypted dataset.

Creating a classification

As a project **Owner**, you can organize encrypted datasets by creating a classification so that project members can use and protect datasets more efficiently.

Before you begin

You must have completed the following tasks:

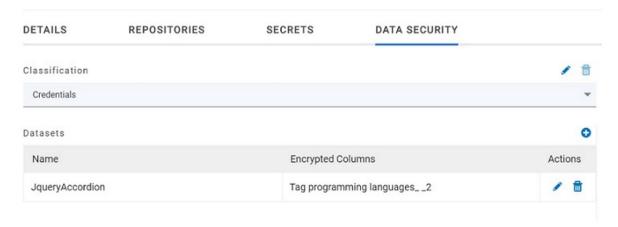

- Created a project in . See Test assets and a server project on page 361.
- Configured the repository that contains the test assets in your project. See Adding repositories to a server project on page 364.
- Created at least one dataset and encrypted the dataset with an encryption key. See Dataset encryption on page 99.

About this task

After creating a classification, you can grant access and provide the encryption key to other members of the project to work with the encrypted dataset.

- 1. Go to the URL.
- 2. Enter your user name and password, and then click Login.
- 3. Open your project from the UI.
- 4. Click Manage, and then the DATA SECURITY tab.
- 5. Click **New classification** and enter a name for the classification.
- 6. Click Create.
- 7. Click the **Add** icon + to select the encrypted dataset to become part of the new classification.
- 8. Select a dataset from the list and enter the encryption key in the **Password** field for the dataset, and then click the **Add** icon.

The encrypted dataset that is added to the classification is displayed.

What to do next

You can grant access to other project members to use the encrypted dataset.

Editing or deleting a classification

After you have created a classification, you can edit the name of the classification. You can also delete a classification when it is not required in your test environment.

Before you begin

You must have completed the following tasks:

- •
- Created at least two classifications. See Creating a classification on page 384.

About this task

You can opt to edit or delete a classification for your project any time after you create a classification. For example, you might want to edit the name of the classification or delete the classification if the classification that is created earlier are not required.

Note: You must be a project Owner to create, edit, or delete a classification.

- To edit a classification, go to Step 1 on page 385.
- To delete a classification, go to Step 2 on page 386.
- 1. Perform the following steps to edit a classification:
 - a.
 - b.

c. Select a classification that you want to edit from the list.

- d. Click the **Edit** icon \mathcal{O} to edit the selected classification.
- e. Edit the name of the classification, and then click Save.
- 2. Perform the following steps to delete a classification:
 - a.
 - b. Select a classification that you want to delete from the list.

 - d. Click **Delete** in the **Delete classification** window to confirm the deletion of the classification.

Note: Before deleting a classification, you must move the added encrypted datasets to another classification else the delete icon is disabled.

Results

- You have edited the name for a classification in your project.
- · You have deleted a classification.

Moving an encrypted dataset to another classification

When you add many encrypted datasets to the same classification, you can move some of them to another classification.

Before you begin

- 1.
- 2.
- 3. Select a classification from the list that has the encrypted dataset.
- 4. Click the **Edit** icon from the **Actions** column of a dataset.

- 5. Select a classification from the list and enter the encryption key of the dataset in the **Password** field.
- 6. Click Save.

A classification for a dataset is updated successfully.

Results

You have moved the encrypted dataset from one classification to another.

Removing a dataset from the classification

You can remove a datasets added to a classification when they are no longer required.

Before you begin

You must have completed the following tasks:

- Created a classification and added the encrypted dataset to it. See Creating a classification on page 384.
- 1.
- 2.
- 3. Select a classification from the list that has an encrypted dataset.
- 4. Click the **Delete** icon improvement from the **Actions** column of a dataset.
- 5. Click Remove in the Change the classification for the Dataset window.

Note: Removing dataset from the classification also removes the password stored in for encrypted data. You must enter the password again to gain access to the encrypted columns.

Results

You have removed the datasets from a classification.

Granting classification access to members or members roles

You can grant or revoke access to the classification in your project to individual members with different roles or the all members with a specific role. Without access to the classification, members cannot view, create, edit, delete, or use the classification.

Before you begin

You must be a project Owner and have completed the following tasks:

- Added one or more users to your project. See Adding users to a server project on page 366.
- Created at least one classification. See Creating a classification on page 384.
- 1.
- 2.
- 3. Select the classification from the drop-down list.
- 4. Choose any of the following methods to grant access to a member:

Choose from:

- To add all members with a specific role, click the role listed under Grant access to role. For example, if
 you select Testers then all members in the project with a tester role are granted access to the selected
 classification. You can select any role or all the roles listed.
- To select specific members to grant access to the selected classification, enter the name or the email ID of the member in the **Grant access to member** field and add them from the list that displays.

Note: Members added specifically are listed under **Members with access to this classification** but the members added for a role are not displayed.

Important: Irrespective of the role that the member (**Owner**, **Tester** or **Viewer**) was assigned in the project, the access to the classification has to be specifically granted to the members from the **DATA SECURITY** tab.

5. Choose any of the following methods to revoke access from a member:

Choose from:

- To remove all members with a specific role, click the role listed under Grant access to role to clear the selection. For example, if Testers is selected and you clear it, then all members in the project with a tester role are removed from the access list to the classification.
- To remove specific member with access to the classification, select the member and click the **Delete** icon

- Any member with access to the classification can remove access of other members specifically added or of all members with a specific role.
- Members with access to the classification can remove themselves from the access list
 provided that there is at least one member in the list. After removing themselves, members
 cannot add themselves back to the access list and must be added by any of the other
 members in the list.

Results

You have granted or revoked the classification access to project members.

Managing notifications

IBM® Rational® Test Automation Server provides a feature to display notifications for different events within the user interface (UI) of Rational® Test Automation Server. You can configure an SMTP server on Rational® Test Automation Server when you want Rational® Test Automation Server to send out notifications about the different events as emails to the subscribed users.

Rational® Test Automation Server provides you the following features to receive notifications about server events:

Channels	Description
In-app	Notifications are displayed within the UI of Rational® Test Automation Server.
SMTP	Notifications are sent by Rational® Test Automation Server in emails to subscribed users.

When you register as a user in Rational® Test Automation Server, the in-app and SMTP channels are automatically subscribed for you.

Managing notifications in the server UI

Viewing the in-app notifications or notifications in the server UI is a feature that is enabled automatically when you register as a user in Rational® Test Automation Server.

You are subscribed to the following channels for all events as the default option when you sign up on the server.

- In-app
- SMTP

If you want to receive notifications about specific events and not all events, you can change the default subscriptions and modify your subscription for the server events. You can also view the in-app notifications that are displayed for you. See Managing in-app notifications on page 390.

Managing SMTP notifications

You, as a *Server Administrator* or *Team Space Owner* can configure an existing Simple Mail Transfer Protocol (SMTP) server so that Rational® Test Automation Server can send out notifications about the server events in emails to the registered users. See Configuring an SMTP server to manage email notifications on page 400.

You are subscribed to the following channels for all events as the default option when you sign up on the server.

- In-app
- SMTP

If you, as a registered user of Rational® Test Automation Server want to receive the email notifications about specific events and not all events, you can change the default subscriptions and modify the subscription for the server events. See Managing email notifications on page 396.

Managing in-app notifications

You can manage the in-app notifications by changing the subscriptions that are automatically enabled for you for all server events. You can view the server events that are automatically subscribed and then change the subscription for any or all events. For example, as a team space owner, you can choose to be notified when members of the team space create new projects or delete their projects but not be notified when tests are run.

Before you begin

•

_

About this task

The in-app notifications that are automatically subscribed for you, are displayed in the server UI under the following categories for the server events that occur:

Category	Notifications displayed
User	Include information about actions performed by team space members in the team space.
System	Include information about actions performed by registered users at the server level.

1.

2. Select from the following actions that you want to perform:

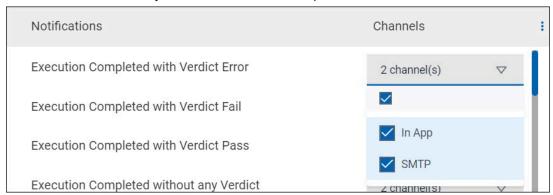

- Modify notification settings. Go to Step 3 on page 391.
- View notifications. Go to Step 4 on page 392.
- Unsubscribe from the in-app notifications. Go to Step 5 on page 393.
- 3. Perform the following steps to modify the notification settings:
 - a. Click the **User** icon ② on the menu bar.
 - b. Click Notification Settings.

The Notification Settings dialog is displayed.

c. Change the language in which you want to receive the notifications, if you do not want to use the default language.

The default language is the locale language set on the computer that hosts .

You can notice that for each of the server events, both the channels are displayed as selected, which is the default selection unless you have modified the subscriptions.

- d. Identify the server events for which you want to change the subscription.
- e. Perform the actions indicated in the following table to clear the subscriptions for server events that you do not want to be notified and to select the in-app subscription for the server events that you want to be notified.

When	Action
You do not want to receive the	Perform the following steps:
in-app notifications for a specif-	i. Expand the channel list in the row of the server event.
ic server event.	ii. Clear the checkbox in the header row to clear the subscrip-
	tions to both channels.
	iii. Click Apply.

When	Action
	You have unsubscribed from both channels and the in-app noti- fications for the server event is not displayed for you when the event occurs.
You want to receive the in-app notifications for a specific server event.	Perform the following steps: i. Expand the channel list in the row of the server event. ii. Select any of the following actions: • Clear the SMTP checkbox. The In App selection is retained while the checkbox in the header row and for the SMTP options are cleared. • Clear the checkbox in the header row to clear the subscriptions to both channels, and then select the In App checkbox. iii. Click Apply. You have unsubscribed from the SMPT channel and retained the subscription for the in-app notifications for the server event.

- f. Go to Results on page 395.
- 4. Perform the following steps to view the in-app notifications:
 - a. Click the **Notifications** icon on the menu bar.

The **Notifications** dialog is displayed. The notifications are displayed in the following tabs:

- User
- System

The notifications in the **USER** tab is displayed as the default option.

- b. View the notifications in the **USER** tab.
- c. Click the **SYSTEM** tab to view the notifications at the server level.

You can find the information about the default notifications that you can view based on your role in the server as in-app notifications in the **USER** tab and **SYSTEM** tab.

Managing email notifications

You can manage the email notifications by changing the subscriptions that are automatically enabled for you for all server events. You can view the server events that are automatically subscribed and then change the subscription for any or all events. For example, as a project owner, you can choose to be notified when members of the project add a repository or run a test in a team space but not be notified when projects are created in the team space.

Before you begin

- Ensured that the or has configured a Simple Mail Transfer Protocol (SMTP) server. See Configuring an SMTP server to manage email notifications on page 400.
- .

About this task

The email notifications in the SMTP channel are automatically subscribed for you for all server events. You can view the server events that are subscribed in the **Notifications Settings** dialog. You can either unsubscribe from the SMPT channel or change your subscriptions for the server events for which you do not want the email notifications.

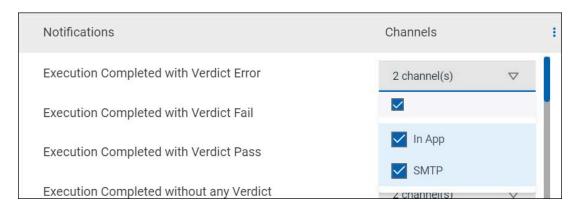

- 1.
- 2. Select from the following actions that you want to perform:
 - Modify notification settings. Go to Step 3 on page 396.
 - Unsubscribe from the email notifications. Go to Step 4 on page 398.
- 3. Perform the following steps to modify the email notifications settings:
 - a. Click the **User** icon ② on the menu bar.
 - b. Click Notification Settings.

The Notification Settings dialog is displayed.

c. Change the language in which you want to receive the email notifications, if you do not want to use the default language.

The default language is the locale language set on the computer that hosts.

You can notice that for each of the server events, both the channels are displayed as selected, which is the default selection unless you have modified the subscriptions.

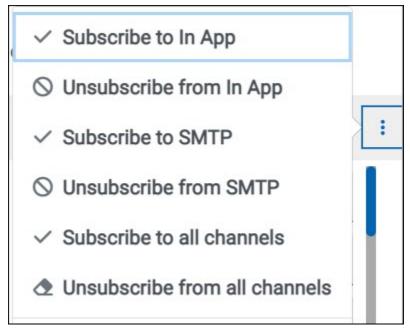

- d. Identify the server events for which you want to change the subscription.
- e. Perform the actions indicated in the following table to clear the subscriptions for server events that you do not want to be notified and to select the SMTP subscription for the server events that you want to be notified in emails.

When	Action
You do not want to receive the email notifications for a specific server event.	Perform the following steps: i. Expand the channel list in the row of the server event. ii. Clear the checkbox in the header row to clear the subscriptions to both channels. iii. Click Apply . You have unsubscribed from both channels and the email notifications for the server event are not sent to you when the event occurs.

Managing notifications on page 389

Configuring an SMTP server to manage email notifications

Before you can receive email notifications about events that occur in Rational® Test Automation Server, you need to configure an existing Simple Mail Transfer Protocol (SMTP) server in Rational® Test Automation Server. When events occur in Rational® Test Automation Server, email notifications are sent to the registered users of Rational® Test Automation Server if they are subscribed to the SMTP notification channel.

Before you begin

You must have completed the following tasks:

- Ensured that you are assigned a role as a *Team Space Owner* in the team space. See Managing members and their roles in a team space on page 358.
- Ensured that an existing SMTP server is available to be connected to Rational® Test Automation Server.

About this task

The configuration works for emails that are supported by the SMTP server. To use this capability, you must enable IBM® Rational® Test Automation Server to connect to the SMTP server to send email notifications.

As a server administrator, you can configure email notifications so that other users can receive information about actions on the server projects.

- 1. Log in to Rational® Test Automation Server and open the team space that contains your project.
- 2. Click the **Settings** icon from the menu bar.

The Notifications page is displayed.

3. Click Add Configuration.

- 4. Provide the following details to configure the SMTP server:
 - A name to the configuration.
 - The host name and port number of the SMTP server.

Note: The default configuration uses a local SMTP server that listens to the default port 25. This SMTP server does not require any authentication.

- The email address of the sender. The email address is displayed in email notifications. The email notifications are sent to the users based on the notification settings.
- The encryption type for secure communications is when the SMTP server is on an external network. You can enable either **STARTTLS** or **SSL/TLS**.

Note: The SMTP server for the secure communication listens to the default port 465.

- Login credentials are required if the SMTP server requires authentication.
- 5. Click Add.

Note: The SMTP configuration is added after a valid connection is established with the SMTP server.

Results

You configured an SMTP server to connect with Rational® Test Automation Server and send out email notifications about the server events to users who have subscribed to the SMTP channel.

What to do next

You can modify the default subscriptions for the SMTP channel, see Managing email notifications on page 396.

Managing notifications on page 389

Chapter 8. Troubleshooting Guide

This guide describes how to analyze and resolve some of the common problems that you might encounter while you work with Rational® Test Automation Server.

In addition to the list of problems that you might encounter, these resources are available to help you troubleshoot Rational® Test Automation Server problems. Known problems of Rational® Test Automation Server are documented in the form of individual technotes in the Support Knowledge Base. As problems are discovered and resolved, the knowledge base is updated and maintained with new information. By searching the knowledge base, you can quickly find workarounds or solutions to problems.

Troubleshooting documentation for Rational® Test Workbench

You can contact IBM® support if you are unable to troubleshoot the problem. Gather all the required background information and provide the details to IBM® support for investigation. For more information, see IBM Support.

Troubleshooting issues

You can find information about the issues or problems that you might encounter while working with Rational® Test Automation Server. Details about issues, their causes and the resolutions that you can apply to fix the issues are described.

The troubleshooting issues are presented to you in the following tables based on where or when you might encounter these issues on Rational® Test Automation Server.

- Table 10: Troubleshooting issues: installation on page 402
- Table 11: Troubleshooting issues: server administration on page 405
- Table 12: Troubleshooting issues: resource monitoring on page 405
- Table 13: Troubleshooting issues: configuring test runs on page 406
- Table 14: Troubleshooting issues: test or stub runs on page 407
- Table 15: Troubleshooting issues: test results and reports on page 410

Table 10. Troubleshooting issues: installation

Problem	Description	Solution
On Ubuntu, when you are installing the server software and you encounter errors in the scripts that are running.	At times, scripts might not appear to be running due to any of the following reasons:	You can complete any of the following tasks:

Table 10. Troubleshooting issues: installation (continued)

-		
Problem	Description	Solution
	 Slow connection speeds. Insufficient CPU, memory, or disk resources. A firewall that was configured incorrectly is already enabled. 	To identify the issue, you can perform a diagnostic check by running the following command: journalctl -u k3s
	This command displays the log that you can use to check for the problem. Run the following command to see which pods are running and which pods are not running:	
	Run the following command to get details about a specific pod:	
	<pre>kubectl describe pod -n <namespace> <pod name=""></pod></namespace></pre>	
		 Follow the on-screen instructions to resolve the errors. Some issues can be solved by re-running the following script:
		sudo ./ubuntu-init.sh
On Ubuntu, DNS is not working as expected.		The DNS configuration that is used by the cluster can be displayed by using the following command:
		<pre>kubectl get cm -n kube-system coredns -ojsonpath="{.data.Corefil e}"</pre>

Table 10. Troubleshooting issues: installation (continued)

Problem	Description	Solution
		The forward setting displays the nameservers that are used. For example, you might see the following in the corefile:
		::53 { : forward . 8.8.8.8 9.9.9.9 :
		A script (ubuntu-set-dns.sh) is supplied for managing these values.
		For example, to set the DNS values for the values shown in the previous example:
		sudo ./ubuntu-set-dns.sh server 8.8.8.8server 9.9.9.9
		Note: If you do not use sudo in the command, the script runs but the configuration might be lost if the cluster is restarted.
		To learn more about the behavior of the script, run the following command:
		sudo ./ubuntu-set-dns.sh help
When running helm install the created pods keep crashing, and the logs	In some instances, the RabbitMQ password is not automatically setup	Manually apply the necessary password:

Problem	Description	Solution
		<pre><release-name>-rabbitmq -o jsonpath='{.data.rabbitmq-p assword}' base64 decode)"</release-name></pre>

Table 11. Troubleshooting issues: server administration

Problem	Description	Solution
When a user is assigned an additional role, the change in the permissions is not observed in the browser.		You must log out of the session and log in again for the changed role to take effect.
You see the following message displayed on Rational® Test Automation Server: You can't request to join a project that has no owners	You requested to join an project that no longer has an owner. Orphaned projects occur when the project owners are deleted. This can occur, for example, when the person leaves the organization.	Ask an administrator to take ownership of the project, and then add you as a member.

Table 12. Troubleshooting issues: resource monitoring

Problem	Description	Solution
You are not able to add a Prometheus server as a Resource Monitoring source.	The cause might be that you have not installed the Prometheus server at the time of server installation.	Verify that the Prometheus server was installed in Helm at the time of server installation. See Installing the server software on Ubuntu by using k3s on page 40. If not, consult your cluster administrator to get the Prometheus server installed and configured.

Table 13. Troubleshooting issues: configuring test runs

Problem	Description	Solution
When you configure a run of a schedule that matches the following conditions: • The schedule has two user groups configured to run on static agents when the schedule was created in Rational® Performance Tester V10.1. • One of the user groups is disabled and the asset is committed to the remote repository. Both the static agents are displayed as available for the test run in the Location tab of the Execute test asset dialog box when only one agent that is configured for the user group must be available.	The cause might be because of the following reasons: • The schedule was created in Rational® Performance Tester V10.1. • The user group that is disabled is not removed or deleted from the test resources. • The agent configured on the disabled user group is already added as an agent to the server project and is available for selection.	To resolve the problem, select from either of the following methods: • By using Rational® Performance Tester V10.1.1. Perform the following steps: 1. Open the schedule in Rational® Performance Tester V10.1.1. 2. Save the schedule and the project. 3. Commit your test asset to the remote repository. 4. Proceed to configure a run for the schedule on Rational® Test Automation Server V10.1.1. • By using Rational® Performance Tester V10.1. Perform the following steps: 1. Select the disabled user group. 2. Click Remove. 3. Save the schedule and the project. 4. Commit your test asset to the remote repository. 5. Proceed to configure a run for the schedule on Rational® Test Automation Server V10.1.1.

Table 13. Troubleshooting issues: configuring test runs (continued)

Problem	Description	Solution
You have added a remote repository to your project that contains the test assets or resources of the following types: Postman JMeter JUnit The test assets or resources are not displayed on the Execution page for you to select the asset for a run.	This problem occurs if the server extension is not enabled. Although the extension was enabled at the time of installation of Rational® Test Automation Server, it was disabled subsequently by the server administrator.	You must verify if the server extension is enabled and running by running the following command:kubectl get pod -n <test-system>, where <test-system> is the namespace that you created to install the server software. The server extensions that are running are displayed. If the server extension that you want is not running implying that the server extension is not enabled. You must enable the server extension. Contact the server administrator to enable the server extension.</test-system></test-system>

You are not able to run the Istio stubs from the Execution page.	The cause might be that the fully qualified domain name is not specified in the Host field for the stub when it was created.	Verify and ensure to add the fully qualified domain name of the server in the Host field when the physical transport for the stub is configured in Rational® Integration Tester.

Note: You can refer to the Kubernetes documentation for information about the different units that can be used for resources in the Additional configuration option fields.

Table 15. Troubleshooting issues: test results and reports

Problem	Description	Solution
You are not able to view the Jaeger traces for the tests you ran.	The cause can be as follows: • Jaeger was not pre-installed in OpenShift. • The Jaeger trace is not supported for the particular test that you ran.	Check for any of the following solutions: • Verify that Jaeger was installed in Helm at the time of server installation. See Installing the server software on Ubuntu by using k3s on page 40. If not, consult your administrator to get Jaeger installed and configured.

		traces. See Test results
		and reports overview on
		page 268.
		Verify if you provided the pro-
		gram variables when you con-
		figured the test run. See Con-
		siderations for using Jaeger
		traces in reports on page 139.

Security Considerations

This document describes the actions that you can take to ensure that your installation is secure, customize your security settings, and set up user access controls.

- Enabling secure communication between multiple applications on page cdxii
- · Ports, protocols, and services on page cdxii
- · Customizing your security settings on page cdxii
- · Setting up user roles and access on page cdxiii

Enabling secure communication between multiple applications

The majority of communications are sent over TLS to port 443 (see Ports, protocols, and services on page cdxii). During the installation, an X.509 certificate is generated for the user provided DNS name, which is used to connect to the server. This certificate is self-signed and hence untrusted by other applications.

This self-signed certificate must be replaced by a certificate signed by a certificate authority trusted by your organization. For more information, see X.509 Certificate User Authentication in the Keycloak documentation.

For information about how the self-signed certificate was created, see the ssl.sh file in the <install-directory>/ prepare/ directory.

For information about importing a certificate authority trusted by your organization, see Importing Certificate Authority into a browser.

Ports, protocols, and services

TCP port 443 is used by the majority of communications with the server.

The port 7085 is the default port for communications with agents registered with Rational® Test Automation Server.

The ports starting from 7085, are used in pairs such as 7085 and 7086, and are allotted for the Schedule that is executed first. The next Schedule is allotted the next pair (7087,7088), and so on for the Schedules that are running simultaneously.

You must open the required ports in pairs for each of the Schedules that you want to run simultaneously.

Customizing your security settings

You can customize your security settings through user registration.

User registration

By default, users can sign up themselves with the server. In some environments, this self sign-up might be undesirable. It can be changed by switching off user registration. For more information, see User Registration in the Keycloak documentation.

By default, user email addresses are not verified. This verification must be enabled in production environments. For more information, see Email settings on page 59.

Setting up user roles and access

You can manage user roles and access through single sign on (SSO) and administration only accounts.

Single sign-on

By default, Keycloak manages users and passwords locally. In production environments, it is normally appropriate to use single sign-on. For more information, see LDAP user administration on page 60.

Administration only accounts

Users in the Administrator group can manage the team space where they can configure licenses and notifications and add a repository to store the System model. For more information, see Team Space overview on page 78.

Users in the Administrator group can also discover all projects stored on the server (including private ones) and assign themselves and others roles in those projects.

For this reason, users who use the server to perform both administration and non-administration tasks must have two different accounts, one for each purpose. For more information, see Default user administration on page 58.
